Introduction to the National Construction Code (NCC)

About the NCC
The NCC is Australia’s primary set of technical design and construction provisions for buildings. As a performance-based code, it sets the minimum required level for the safety, health, amenity, accessibility and sustainability of certain buildings. It primarily applies to the design and construction of new buildings, and plumbing and drainage systems in new and existing buildings. In some cases it may also apply to structures associated with buildings and new building work or new plumbing and drainage work in existing buildings.

The Australian Building Codes Board (ABCB), on behalf of the Australian Government and each State and Territory government, produces and maintains the NCC. When determining the content of the NCC, the ABCB seeks to—

• ensure requirements have a rigorously tested rationale; and
• effectively and proportionally address applicable issues; and
• create benefits to society that outweigh costs; and
• consider non-regulatory alternatives; and
• consider the competitive effects of regulation; and
• not be unnecessarily restrictive.

The primary users of the NCC include architects, builders, plumbers, building surveyors, hydraulic consultants, engineers and other building and plumbing related professions and trades.

Format of the NCC
The NCC is published in three volumes. The Building Code of Australia (BCA) is Volumes One and Two of the NCC and the Plumbing Code of Australia (PCA) is Volume Three of the NCC.

Components of the NCC
The NCC provides the technical provisions for the design and construction of buildings and other structures, and plumbing and drainage systems.

NCC Volume One primarily covers the design and construction of multi-residential, commercial, industrial and public assembly buildings and some associated structures.

NCC Volume Two primarily covers the design and construction of smaller scale buildings including houses, small sheds, carports and some associated structures.

NCC Volume Three covers the design, construction and maintenance of plumbing and drainage systems in new and existing buildings.

Each volume contains—

• Governing Requirements; and
• Performance Requirements; and
• compliance options to meet the NCC requirements; and
• State and Territory variations and additions.

The NCC uses building classifications to identify requirements for different intended purposes of buildings or parts of buildings. A building classification relates to the characteristics and the intended use of the building. Information on building classifications is found in Part A6 of the Governing Requirements.

Legislative arrangements and the NCC
The NCC is given legal effect through State and Territory, or other statutory authority, building and plumbing legislation. These Acts and Regulations set out the legal framework and administration mechanisms for the NCC to support the design and construction of buildings.
The dates of adoption of the NCC are determined by State and Territory building and plumbing administrations.

**How to use the NCC**

Each volume of the NCC is split into two main sections:

- Administrative requirements contained within the Governing Requirements.
- Technical requirements contained within the remaining sections of the NCC.

The Governing Requirements provide the rules and instructions for using and complying with the NCC. They are vital in understanding how the technical requirements of the NCC should be applied to any particular situation. The Governing Requirements are also important in understanding how the NCC fits with the building and plumbing regulatory framework within Australia.

**NCC clause numbering system**

The NCC uses a uniform clause numbering system across each of its three volumes. This system is called Section-Part-Type-Clause (SPTC). In each clause number—

- The first letter indicates which NCC Section sits within, or if the letter S is used, that the clause is part of a Specification. The letter S is used in place of a Section indicator because the same Specification may be called up in several different Sections of the NCC.
- The first number indicates the number of each Part within a Section, or the number of a Specification. Parts are numbered sequentially within each Section, starting at 1. Specifications are numbered sequentially across all three volumes, also starting at 1.
- The second letter indicates the clause Type. It will be either G, O, F, P, V, D or C and these are explained below.
- The second number is the clause number within each Part or Specification.

The clause Types used in the NCC are as follows:

- **G** = Governing requirement (mandatory)
- **O** = Objective (guidance)
- **F** = Functional Statement (guidance)
- **P** = Performance Requirement (mandatory)
- **V** = Verification Method (optional)
- **D** = Deemed-to-Satisfy Provision (optional)
- **C** = Clause in a Specification (clauses in Specifications may be mandatory or optional, depending on how the Specification is called up by the NCC).

Informative parts of the NCC (e.g. Introduction to the NCC) are not numbered and do not have numbered paragraphs. This helps make it easy to see that their content is information only and does not contain any regulatory requirements.
About NCC Volume Two

NCC Volume Two contains technical design and construction requirements for certain residential and non-habitable buildings and structures.

Volume Two contains the requirements for—

- Class 1 and 10a buildings (other than access requirements for people with a disability in Class 1b and 10a buildings); and
- certain Class 10b structures (other than access requirements for people with a disability in Class 10b swimming pools); and
- Class 10c private bushfire shelters.

Components of NCC Volume Two

NCC Volume Two contains the following Sections:

- Section A – Governing Requirements
- Section H – Housing:
  - Part H1 – Structure
  - Part H2 – Damp and weatherproofing
  - Part H3 – Fire safety
  - Part H4 – Health and amenity
  - Part H5 – Safe movement and access
  - Part H6 – Energy efficiency
  - Part H7 – Ancillary provisions and additional construction requirements
- Schedules—
  - Abbreviations and symbols
  - Definitions
  - Referenced documents
  - State and Territory variations and additions
List of NCC Specifications

Table 1 sets out the number and title of each NCC Specification, along with the clauses in each NCC Volume that refer to the Specification.

Table Notes:
1. 1 January 2002 (except SA2 - date to be advised).
2. 1 July 2002 (except Australian Capital Territory additions - which was adopted on 21 June 2002).
3. 1 July 2003 except for Parts 2.6 and 3.12 which are adopted on 1 September 2003.
4. 1 May 2006, except for South Australian variations P2.6.2, V2.6.2.3 and 3.12.5.4 and South Australian addition SA2 which were adopted on 1 July 2006. The adoption of South Australian variation clause 3.7.4.2 is yet to be advised.
5. 1 May 2007, excluding South Australian variation clause 3.7.4.2, (for the purposes of sub-clauses (1) and (2) of Schedule 18 of the Development Regulations 1993): and sub-clause c) of variation clause 3.7.4.2 (for the purpose of sub-clauses (3) and (4) of Schedule 18 of the Development Regulations 1993).
6. 1 May 2010 except for Parts 2.6 and 3.12, which were adopted on 1 September 2010, and the restriction on child resistant door sets in 3.9.3.0 and the additional bushfire requirements for ‘excluded areas’ prescribed in SA 3.7.4.2(d) and (e), which were adopted on 2 December 2010.

BCA 96 Amendment No. 1
Amendment No. 1 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 1 is to—
- include typographical changes including spelling, punctuation, cross references and layout; and
- include reference to a Certificate of Conformity issued by the ABCB in A2.2; and
- change the reference to the Standards Mark Certificate to refer to JAS–ANZ in A2.2; and
- update references to Standards.
Note: The revisions contained in Amendment No. 1 to the Housing Provisions have not been marked in the text.

BCA 96 Amendment No. 2
Amendment No. 2 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 2 is to—
- include typographical changes including spelling, punctuation, cross references and layout; and...
• update references to Standards; and
• include minor technical changes.

BCA 96 Amendment No. 3
Amendment No. 3 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 3 is to—
• incorporate the outcomes of the 1997 ABCB Variations Conference; and
• update references to Standards; and
• include minor technical changes.

BCA 96 Amendment No. 4
Amendment No. 4 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 4 is to—
• update references to Standards; and
• include minor technical changes.

BCA 96 Amendment No. 5
Amendment No. 5 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 5 is to—
• update references to Standards; and
• expand on the requirements for subfloor ventilation based on climatic conditions; and
• revise the Acceptable Construction Practice for Steel framing; and
• include additional details in the Acceptable Construction Practice for fencing of swimming pools; and
• include minor technical changes.

BCA 96 Amendment No. 6
Amendment No. 6 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 6 is to—
• update references to Standards; and
• revise the Acceptable Construction Practice for Footing and Slab Construction; and
• replace Sound Transmission Class (STC) with weighted sound reduction index ($R_w$) within Part 3.8.6; and
• include minor technical changes.

BCA 96 Amendment No. 7
Amendment No. 7 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 7 is to—
• update references to Standards; and
• include requirements for separation of eaves and verandah spaces that are open to the roof space and common to
  2 or more Class 1 buildings; and
• reinstate the Acceptable Construction Practice for buildings in bushfire-prone areas, following alignment with the 1999
  version of AS 3959; and
• change the limitations on winders used in lieu of quarter and half landings within stairways; and
include minor technical changes.

**BCA 96 Amendment No. 8**

Amendment No. 8 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.

The purpose of Amendment No. 8 is to—
- update references to Standards; and
- include minor technical changes; and
- achieve greater consistency between both Volumes of the BCA for stair construction.

**BCA 96 Amendment No. 9**

Amendment No. 9 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.

The purpose of Amendment No. 9 is to—
- update references to Standards; and
- include minor technical changes; and
- clarify which glazing assemblies must comply with AS 2047 and which must comply with AS 1288.

**BCA 96 Amendment No. 10**

Amendment No. 10 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.

The purpose of Amendment No. 10 is to—
- update references to Standards; and
- update the requirements for protective coatings for steelwork in locations near saltwater; and
- align Figure 3.6.1 dealing with glazing with AS 1288; and
- extend the concession for fire separation of windows in non-habitable rooms to windows in bathrooms, laundries and toilets and also include buildings on the same allotment; and
- replace testing to AS/NZS 1530.3 for timber in bushfire areas with reference to AS/NZS 3837; and
- include minor technical changes.

**BCA 96 Amendment No. 11**

Amendment No. 11 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.

The purpose of Amendment No. 11 is to—
- update references to Standards; and
- transfer public policy matters, with respect to structural adequacy, from the AS 1170 series to the BCA; and
- introduce new definitions and more detailed provisions on the installation of flashings and damp-proof courses; and
- include minor technical changes.

**BCA 96 Amendment No. 12**

Amendment No. 12 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.

The purpose of Amendment No. 12 is to—
- update references to Standards; and
- allow the use of either the 1989 editions or the 2002 editions of the 1170 series of standards; and
- include Energy Efficiency measures into the Housing Provisions; and
- include minor technical changes.
Note: Only substantive typographical corrections are noted in the margin.

BCA 96 Amendment No. 13
Amendment No. 13 of the 1996 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of Amendment No. 13 is to—
• update references to Standards; and
• refine the Energy Efficiency provisions and advise of their adoption in Western Australia and Queensland; and
• include minor technical changes.
Note: Only substantive typographical corrections are noted in the margin.

Adoption of BCA 2004 Volume Two
The 2004 edition of the BCA was adopted as set out in Table 1.
The purpose of BCA 2004 Volume Two is to—
• remove references to BCA 96; and
• clarify the method of determining the Performance Requirements that are relevant to Alternative Solutions; and
• update references to other documents; and
• revise the acceptable construction practice for footing and slab construction; and
• prohibit the use of lead on roofs used to collect potable water; and
• reform the provisions for sound insulation; and
• update the Energy Efficiency provisions; and
• include minor technical changes.

Adoption of BCA 2005 Volume Two
The 2005 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of BCA 2005 Volume Two is to—
• update references to other documents; and
• update the provisions for waterproofing of wet areas; and
• update balustrading provisions to include wire balustrades; and
• include minor technical changes.

Adoption of BCA 2006 Volume Two
The 2006 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of BCA 2006 Volume Two is to—
• update references to other documents; and
• convert the W wind speed categories to the N and C wind speed categories; and
• include a national testing regime for cladding in cyclonic areas; and
• include enhanced energy efficiency provisions; and
• include minor technical changes.

Adoption of BCA 2007 Volume Two
The 2007 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of BCA 2007 Volume Two is to—

- update references to other documents; and
- clarify that compliance with either the appropriate acceptable construction manuals or the appropriate acceptable construction practice set out in Section 3 is deemed to comply with the Performance Requirements; and
- clarify when it is appropriate to use the acceptable construction practice for the installation of glazing and when it is necessary for windows to comply with AS 2047; and
- update acceptable construction practice for the installation of glazing to align with recent changes to AS 1288; and
- update Energy Efficiency provisions including providing clarification and additional information; and
- include minor technical changes.

Adoption of BCA 2008 Volume Two
The 2008 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of BCA 2008 Volume Two is to—

- update references to other documents; and
- include lists of other legislation affecting buildings in the various States and Territories; and
- include provisions for swimming pool water recirculation systems; and
- include minor technical changes.

Adoption of BCA 2009 Volume Two
The 2009 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of BCA 2009 Volume Two is to—

- update references to other documents; and
- after expiry of the agreed transition period, except for the 1993 edition of AS 1170.4, delete all references to the older loading standards contained in the AS 1170 series and consequently, all provisions referring to them; and
- simplify the wire balustrade provisions including the addition of a Verification Method; and
- clarify the height of rooms in an attic and with a sloping ceiling; and
- clarify the provisions for the construction of sanitary compartments to enable an unconscious occupant to be removed; and
- further update the energy efficiency provisions; and
- include minor technical changes.

Adoption of BCA 2010 Volume Two
The 2010 edition of the BCA Volume Two was adopted as set out in Table 1.
The purpose of BCA 2010 Volume Two is to—

- update references to other documents; and
- delete reference to the 1993 edition of AS 1170.4 and consequently all provisions referring to it; and
- increase the stringency of the energy efficiency provisions and, as part of reducing greenhouse gas emissions, introduce provisions for lighting and the greenhouse gas intensity of the energy source for services such as water and space heaters; and
- update Part 3.7.4, as a consequence of referencing the 2009 edition of AS 3959 Construction of buildings in bushfire-prone areas, including—
  - applying the provisions to a Class 10a building or deck associated with a Class 1 building; and
  - the deletion of the acceptable construction practice; and
- include minor technical changes.
Adoption of NCC 2011 Volume Two

The 2011 edition of the NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2011 Volume Two is to—

• update references to other documents; and
• include provisions for private bushfire shelters for Class 1 dwellings; and
• revise the definition of Class 1b buildings; and
• include minor technical changes.

Adoption of NCC 2012 Volume Two

The 2012 edition of the NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2012 Volume Two is to—

• update references to other documents; and
• include revised provisions aimed at reducing slips, trips and falls in buildings; and
• remove the acceptable construction practice for masonry following the referencing of AS 4773 Masonry for small buildings, and completion of a 12 month transition period; and
• restructure the acceptable construction practice for wet areas; and
• include minor technical changes.

Adoption of NCC 2013 Volume Two

The 2013 edition of the NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2013 Volume Two is to—

• update references to other documents; and
• include new provisions for openable windows to reduce falls in buildings; and
• include a Performance Requirement and reference a Standard for construction in flood hazard areas; and
• include minor technical changes.

Adoption of NCC 2014 Volume Two

The 2014 edition of the NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2014 Volume Two is to—

• update references to other documents; and
• quantify slip resistance on stair treads in Class 1 buildings; and
• relocate the energy efficiency provisions for heated water systems to NCC Volume Three; and
• expand the energy efficiency heating options for swimming pools and associated spa pools; and
• include a new acceptable construction practice for hardboard cladding; and
• include minor technical changes.

Adoption of NCC 2015 Volume Two

The 2015 edition of the NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2015 Volume Two is to—

• update references to other documents; and
• include a Verification Method for structural reliability; and
• include a Verification Method for weatherproofing of external walls; and
• include revised Acceptable Construction Practice for termite management systems.

Adoption of NCC 2016 Volume Two
The 2016 edition of NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2016 Volume Two is to—
• update references to other documents; and
• amend the “Introduction” and “General Requirements” as part of the initiative to increase the use of Performance Solutions; and
• include new Verification Methods for structural robustness and indoor air quality; and
• include changes as a result of the Acceptable Construction Practice Review project, including the provisions for termite risk management, subfloor ventilation, facilities, light and ventilation and stair construction; and
• include requirements for overflow of eaves gutters; and
• include minor technical changes.

Adoption of NCC 2019 Volume Two
The 2019 edition of NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC 2019 Volume Two is to—
• include the Governing Requirements, that result from revision of Part 1 to improve readability and are common to all volumes; and
• introduce the use of schedules that are common to all volumes; and
• include new Verification Methods; and
• include changes resulting from review of acceptable construction practice, including amendments for earthworks, masonry, roof and wall cladding, fire safety and alpine areas; and
• update references to other documents; and
• include minor technical changes.

NCC 2019 Amendment No. 1
Amendment No. 1 to the 2019 edition of NCC Volume Two was adopted as set out in Table 1.

The purpose of NCC Volume Two Amendment 1 is to—
• require that a process be followed to improve the quality of and documentation for Performance Solutions; and
• require labelling of Aluminium Composite Panels; and
• clarify that anti-ponding board requirements only apply to roofs where sarking is installed.
Section A  Governing requirements

S3C2  General requirement
S3C3  Form of test
S3C4  Test specimens
S3C5  Concession
S3C6  Smaller specimen permitted
Part A1  Interpreting the NCC

Introduction to this Part
This Part explains important concepts on how the NCC must be interpreted and applied. There are certain conventions and approaches that need to be taken into account when using the NCC. This includes interpreting specific language and terms. This is critical to understanding the intended technical and legal meaning of the NCC. This Part also explains the difference between the mandatory parts of the NCC and the parts that are only explanatory or guidance in nature.

Governing Requirements

A1G1  Scope of NCC Volume One  

NCC Volume One contains the requirements for—

(a)  all Class 2 to 9 buildings; and
(b)  access requirements for people with a disability in Class 1b and 10a buildings; and
(c)  certain Class 10b structures including access requirements for people with a disability in Class 10b swimming pools.

A1G2  Scope of NCC Volume Two  

NCC Volume Two contains the requirements for—

(a)  Class 1 and 10a buildings (other than access requirements for people with a disability in Class 1b and 10a buildings); and
(b)  certain Class 10b structures (other than access requirements for people with a disability in Class 10b swimming pools); and
(c)  Class 10c private bushfire shelters.

A1G3  Scope of NCC Volume Three  

(1)  NCC Volume Three contains technical requirements for the design, construction, installation, replacement, repair, alteration and maintenance for plumbing and drainage systems in new and existing buildings.
(2)  NCC Volume Three applies to these systems in all classes of buildings whenever plumbing and drainage work is carried out.
(3)  NCC Volume Three additionally applies to sites where services are constructed independently of buildings.

A1G4  Interpretation  

(1)  The following components of the NCC are non-mandatory and informative:
(a)  Content identified as “explanatory information”.
(b)  The “Introduction to this Part” information, located at the beginning of each Volume, Section or Part.

(2)  Words in italics must be interpreted in accordance with—
(3) The NCC must be interpreted and applied in accordance with the following:

(a) A reference to a building is a reference to an entire building or part of a building (as the case requires).

(b) A reference to a plumbing or drainage solution, or product in Volume Three is a reference to an entire installation, system or product, or part of an installation, system or product (as the case requires).

(c) A reference in a Performance Requirement to “the degree necessary” means—
   (i) that consideration of all the criteria referred to in the Performance Requirement will determine the outcome appropriate to the circumstances; and
   (ii) that in certain cases it may not be necessary to incorporate any specific measures to meet the relevant Performance Requirement.

(d) An “Application” statement is mandatory and is provided to specify where and when a requirement or provision applies.

(e) A “Limitation” statement is mandatory and is provided to specify where and when the application of a requirement or provision is limited to a certain circumstance.

(f) An “Exemption” statement is mandatory and is provided to specify where or when a requirement or provision does not need to be complied with.

(g) A “Note” is part of a provision or requirement and provides additional mandatory instructions.

(h) Figures in the NCC—
   (i) are used to illustrate specific issues referenced in the associated text; and
   (ii) are not to be construed as containing all design information that is required for that particular building element or situation.

(i) The defined symbols and abbreviations listed in Schedule 1.

4) A reference to a building class is a reference to all the sub-classifications of that class.

5) The following sub-classifications apply:

(a) Classes 1a and 1b are sub-classifications of Class 1.

(b) Classes 7a and 7b are sub-classifications of Class 7.

(c) Classes 9a, 9b and 9c are sub-classifications of Class 9.

(d) Classes 10a, 10b and 10c are sub-classifications of Class 10.

6) A reference to a sub-classification is solely to that sub-classification.

Notes:
For Volume Three, if a word is not defined in Schedule 2, the meaning (if any) attributed to it under AS/NZS 3500.0 should be used unless the contrary intention appears.

Explanatory Information:
Explanatory Information and Introduction to this Section information contained in the NCC are non-mandatory and are provided for guidance purposes only. This informative material should be read in conjunction with the technical provisions of the NCC. Any statements made in the informative and guidance components of the NCC should not be taken to override the NCC. Unlike the NCC, which is adopted by legislation, the informative and guidance components are not called up into legislation and they do not cover State and Territory variations and additions. Because informative and guidance components of the NCC do not have regulatory force, the ABCB accepts no responsibility for its contents when applied to specific buildings or any liability which may result from its use.

Defined words provide the precise meaning and expressions of key words used for understanding and complying with the NCC. Where a word is not defined in the NCC, the relevant common meaning of the word should be used.

Generally, a reference to a building is a reference to the whole building, regardless of classification. However, when a
provision is applicable to a specific class or classes of building, that reference to a building may be a reference to the whole building or part of the building depending on how the building is classified.

Whether a provision applies or not depends on the circumstances of the case and the circumstances in which the reference is made. For example, where a building has a single classification, a reference to a building in the NCC is understandably a reference to a whole building. However, where a building has parts of different classification, unless the contrary intention appears (i.e. there is a specific reference to the whole building), a reference to a building in the NCC is a reference to the relevant part of the building. This means that each part of the building must comply with the relevant provisions for its classification.

A number of the Performance Requirements of the NCC use the expression “to the degree necessary” or “appropriate to”. These expressions provide flexibility by allowing appropriate authorities to determine the degree of compliance necessary in a particular case. Therefore, any part of the NCC that uses these expressions should be referenced against the requirements of the appropriate authority. For example, an appropriate authority might judge that an item need not be installed, or a particular level of performance be achieved.

Application, Limitation, and Exemption statements are used to identify provisions that may or may not apply in certain situations, to varying degrees.

Classes 1a and 1b, 7a and 7b, 9a, 9b and 9c, and 10a, 10b and 10c are separate classifications. In the NCC, when the designation ‘a’, ‘b’ or ‘c’ is not applied, the reference is to all buildings of the general class. For example, ‘Class 9b’ refers only to Class 9b buildings, but ‘Class 9’ refers to Classes 9a, 9b and 9c.

Figures are used to explain the requirements of a particular clause. To ensure the context of the requirement is clearly understood, adjacent construction elements of the building that would normally be required in that particular situation are not always shown. Accordingly, aspects of figures that are not shown should not be interpreted as meaning these construction details are not required. Therefore a figure must not be used as an indication of the full construction requirements in a given situation, as the only available option, or a substitute for referencing appropriate construction requirements (in other sources) for a given clause.
Introduction to this Part

This Part explains the possible methods of demonstrating compliance with the NCC. It explains the various compliance pathways within the NCC and the appropriate steps that must be taken for each of these pathways.

Governing Requirements

A2G1 Compliance

(1) Compliance with the NCC is achieved by complying with—
   (a) the Governing Requirements of the NCC; and
   (b) the Performance Requirements.

(2) Performance Requirements are satisfied by one of the following, as shown in Figure A2G1:
   (a) Performance Solution.
   (b) Deemed-to-Satisfy Solution.
   (c) A combination of (a) and (b).

Figure A2G1: NCC compliance structure

A2G2 Performance Solution

(1) A Performance Solution is achieved by demonstrating—
   (a) compliance with all relevant Performance Requirements; or
   (b) the solution is at least equivalent to the Deemed-to-Satisfy Provisions.

(2) A Performance Solution must be shown to comply with the relevant Performance Requirements through one or a combination of the following Assessment Methods:
   (a) Evidence of suitability in accordance with Part A5 that shows the use of a material, product, plumbing and drainage product, form of construction or design meets the relevant Performance Requirements.
   (b) A Verification Method including the following:
      (i) The Verification Methods provided in the NCC.
      (ii) Other Verification Methods, accepted by the appropriate authority that show compliance with the relevant Performance Requirements.
(c) **Expert Judgement.**

(d) Comparison with the **Deemed-to-Satisfy Provisions.**

(3) Where a **Performance Requirement** is satisfied entirely by a **Performance Solution**, in order to comply with (1) the following method must be used to determine the **Performance Requirement** or **Performance Requirements** relevant to the **Performance Solution**:

(a) Identify the relevant **Performance Requirements** from the Section or Part to which the **Performance Solution** applies.

(b) Identify **Performance Requirements** from other Sections or Parts that are relevant to any aspects of the **Performance Solution** proposed or that are affected by the application of the **Performance Solution**.

(4) Where a **Performance Requirement** is proposed to be satisfied by a **Performance Solution**, the following steps must be undertaken:

(a) Prepare a **performance-based design brief** in consultation with relevant stakeholders.

(b) Carry out analysis, using one or more of the Assessment Methods listed in (2), as proposed by the **performance-based design brief**.

(c) Evaluate results from (4)(b) against the acceptance criteria in the **performance-based design brief**.

(d) Prepare a final report that includes—
   (i) all **Performance Requirements** and/or **Deemed-to-Satisfy Provisions** identified through A2G2(3) or A2G4(3) as applicable; and
   (ii) identification of all **Assessment Methods** used; and
   (iii) details of steps (4)(a) to (4)(c); and
   (iv) confirmation that the **Performance Requirement** has been met; and
   (v) details of conditions or limitations, if any exist, regarding the **Performance Solution**.

**A2G3 Deemed-to-Satisfy Solution**

[2019: A2.3]

(1) A solution that complies with the **Deemed-to-Satisfy Provisions** is deemed to have met the **Performance Requirements**.

(2) A **Deemed-to-Satisfy Solution** can show compliance with the **Deemed-to-Satisfy Provisions** through one or more of the following **Assessment Methods**:

   (a) Evidence of suitability in accordance with **Part A5** that shows the use of a material, product, **plumbing** and **drainage product**, form of construction or design meets a **Deemed-to-Satisfy Provision**.

   (b) **Expert Judgement.**

**A2G4 A combination of solutions**

[2019: A2.4]

(1) **Performance Requirements** may be satisfied by using a combination of **Performance Solutions** and **Deemed-to-Satisfy Solutions**.

(2) When using a combination of solutions, compliance can be shown through the following, as appropriate:

   (a) A2G2 for assessment against the relevant **Performance Requirements**.

   (b) A2G3 for assessment against the relevant **Deemed-to-Satisfy Provisions**.

(3) Where a **Performance Requirement** is satisfied by a **Performance Solution** in combination with a **Deemed-to-Satisfy Solution**, in order to comply with (1), the following method must be used to determine the **Performance Requirement** or **Performance Requirements** relevant to the **Performance Solution**:

   (a) Identify the relevant **Deemed-to-Satisfy Provisions** of each Section or Part that are to be the subject of the **Performance Solution**.

   (b) Identify the **Performance Requirements** from the same Sections or Parts that are relevant to the identified
Deemed-to-Satisfy Provisions.

(c) Identify Performance Requirements from other Sections or Parts that are relevant to any aspects of any Performance Solution proposed or that are affected by the application of the Deemed-to-Satisfy Provisions that are the subject of the Performance Solution.

Explanatory Information:

To comply with the NCC, a solution must achieve compliance with the Governing Requirements and the Performance Requirements. The Governing Requirements contain requirements about how the Performance Requirements must be met.

Performance Requirements outline the minimum necessary standards different buildings or building elements must attain. The Performance Requirements are the only NCC technical provisions that must be satisfied.

In some instances, State and Territory variations and additions may also be applicable to certain Performance Requirements.

A solution may be partly a Performance Solution and partly a Deemed-to-Satisfy Solution. However, no matter what method is chosen, building proponents need to always meet the Performance Requirements of the NCC.

A2G2(2)(b)(ii) provides for the use of Verification Methods that are not listed in the NCC. A Verification Method may include—

- a calculation, using analytical methods or mathematical models; or
- a test, using a technical procedure, either on-site or in a laboratory, to directly measure the extent to which the Performance Requirements have been met; or
- an inspection (and inspection report); or
- any other acceptable form of certification.

Any Verification Method used must be acceptable to the appropriate authority.

A Performance Solution must comply with all applicable Performance Requirements of the NCC. A Performance Solution provides a tailored solution to meet the intended objective of the Performance Requirements. A Performance Solution must comply with all relevant Performance Requirements and must be verified using one or a combination of the following Assessment Methods:

- Evidence of suitability.
- Verification Method.
- Expert Judgement.
- Comparison with the Deemed-to-Satisfy Provisions.

For example, building proponents who wish to know what has to be done to satisfy the fire safety Performance Requirements for a particular building can either follow the Deemed-to-Satisfy Provisions or develop a Performance Solution. Guidance on how to develop Performance Solutions can be found on the ABCB website at: www.abcb.gov.au. The ABCB Resource Library contains information on the development of Performance Solutions for both building and plumbing.

A Deemed-to-Satisfy Solution is achieved by following all appropriate Deemed-to-Satisfy Provisions in the NCC. The Deemed-to-Satisfy Provisions are prescriptive (i.e. like a recipe book, they tell you how, what and in which location things must be done). They include materials, components, design factors, and construction methods that, if used, are deemed to meet the Performance Requirements, hence the term “Deemed-to-Satisfy”.

A Deemed-to-Satisfy Solution may be verified using one or a combination of the following Assessment Methods:

- Evidence of suitability.
- Expert Judgement.

Some Performance Requirements are without Deemed-to-Satisfy Solutions. Compliance with these Performance Requirements must be achieved by using a Performance Solution.

When designing a building or plumbing or drainage system, both Performance Solutions and Deemed-to-Satisfy Solutions can be used to achieve compliance with Performance Requirements. A combination of solutions may be used to satisfy a single Performance Requirement. This may include occasions where a specific Performance Requirement covers a number of elements of a building or plumbing or drainage system.

No NCC provision can be considered in isolation. Any departure from the Deemed-to-Satisfy Provisions for a
A Performance Solution needs to be assessed against the relevant Performance Requirements within the relevant NCC Section or Part. Additionally, the proposed Performance Solution may also impact on other Performance Requirements in other Sections or Parts. Thus, these additional Performance Requirements need to be considered in relation to the subject Performance Solution. A2G2(3) and A2G4(3) set out the methods for determining which Performance Requirements are relevant.

It is important that a holistic approach is used when determining the appropriate Performance Requirements.

More information on NCC compliance methods is located at www.abcb.gov.au.

A2G4(2)(a) references A2G2. Therefore, when using a combination of Performance Solutions and Deemed-to-Satisfy Solutions it is necessary to comply with A2G2(4) where a Performance Requirement is proposed to be satisfied by a Performance Solution.
Part A3  Application of the NCC in States and Territories

Introduction to this Part
This Part explains applying the NCC in accordance with State or Territory legislation. The NCC has legal effect through references in relevant State or Territory building and plumbing legislation.
Although the NCC is a nationally consistent code, there are some situations where a State or Territory enforces a variation, addition or deletion to it. This Part also explains how these variations, additions and deletions apply.

Governing Requirements

A3G1  State and Territory compliance

(1) For application within a particular State or Territory, the Volumes of the NCC comprise inclusively of—
   (a) Sections A to J and associated schedules of Volume One; and
   (b) Sections A and H and associated schedules of Volume Two; and
   (c) Sections A to E and associated schedules of Volume Three.

(2) State and Territory variations, additions and deletions must be complied with in conjunction with the NCC.

(3) The NCC is subject to, and may be overridden by, State or Territory legislation.

(4) State and Territory variations, additions and deletions are contained in the following Schedules:
   (a) Schedule 3: Commonwealth of Australia.
   (b) Schedule 4: Australian Capital Territory.
   (c) Schedule 5: New South Wales.
   (d) Schedule 6: Northern Territory.
   (e) Schedule 7: Queensland.
   (f) Schedule 8: South Australia.
   (g) Schedule 9: Tasmania.
   (h) Schedule 10: Victoria.
   (i) Schedule 11: Western Australia.

(5) State and Territory variations and deletions are identified throughout the NCC.

Explanatory Information:
The NCC is given legal effect by building regulatory legislation in each State and Territory. This legislation consists of an Act of Parliament and subordinate legislation which empowers the regulation of certain aspects of building and plumbing, and contains the administrative provisions necessary to give effect to the legislation.

Although the NCC is a national code, in some instances it is necessary for a State or Territory to vary or apply additional requirements specific to their jurisdiction. A3G1(2) highlights that these variations, additions or deletions must be applied in conjunction with the NCC provisions. Typically, these variations, additions or deletions override the requirements contained within the NCC.

Any provision of the NCC may be overridden by, or subject to, State or Territory legislation. The NCC must therefore be read in conjunction with that legislation. Any queries on such matters should be referred to the State or Territory authority responsible for building and plumbing regulatory matters.

Where a requirement or provision of the NCC is subject to a State or Territory variation, addition, or deletion, a reference to the appropriate provision in the applicable State or Territory schedule is included with that requirement or provision.
Introduction to this Part

This Part explains how documents referenced in the NCC are adopted and applied. The NCC itself does not contain details of every design and construction requirement for a building or plumbing or drainage system. As such, the NCC calls upon or "references" other documents with this information. These are called NCC referenced documents. Examples of such documents are Australian Standards, ABCB protocols, ABCB standards and other publications.

There are multiple types of referenced documents. A primary referenced document is one referenced in Schedule 3 of the NCC. A secondary referenced document is one referenced in a primary referenced document. Other referenced documents are referenced by secondary and subsequently referenced documents.

### Governing Requirements

#### A4G1  Referenced documents

[2019: A4.0]

1. A reference in the NCC to a document refers to the edition or issues and any amendment listed in Schedule 3.
2. A document referenced in the NCC is only applicable in the context in which the document is quoted.

**TAS A4G1(3)**

3. Where a new edition, issue or amendment of a primary referenced document is not listed in Schedule 3, the new edition, issue or amendment is not referenced for the purpose of the NCC.
4. Any document referenced in a primary referenced document is known as a secondary referenced document.
5. A reference in a primary referenced document to a secondary or other referenced document is a reference to the document as it existed at the time of publication of the primary referenced document.

**Applications:**

A4G1 applies to documents referenced in the ABCB Housing Provisions in the same way as for documents referenced within any other part of the NCC.

**Exemptions:**

If the secondary or other referenced document is also a primary referenced document, A4G1(5) does not apply.

#### A4G2  Differences between referenced documents and the NCC

[2019: A4.1]

The NCC overrules any difference between the NCC (including the ABCB Housing Provisions) and a primary referenced document, including any secondary referenced document.

**Applications:**

A4G2 applies to documents referenced in the ABCB Housing Provisions in the same way as for other documents referenced by Volumes One, Two or Three of the NCC.
A4G3 Adoption of referenced documents

The NCC does not require compliance with requirements in relation to the following matters where they are prescribed in a referenced document:

(a) The rights, responsibilities or obligations between the manufacturer, supplier or purchaser.
(b) The responsibilities of any tradesperson or other building operative, architect, engineer, authority, or other person or body.
(c) The submission for approval of any material, building component, form or method of construction, to any person, authority or body other than those empowered under State or Territory legislation to give that approval.
(d) The submission of a material, product, form of construction or design to any person, authority or body for opinion.
(e) Any departure from the NCC, rule, specification or provision at the sole discretion of the manufacturer or purchaser, or by arrangement or agreement between the manufacturer and purchaser.

Applications:
A4G3 applies to documents referenced in the ABCB Housing Provisions in the same way as for documents referenced within Volumes One, Two or Three of the NCC.

Explanatory Information:
Schedule 32 is only mandatory to Deemed-to-Satisfy Provisions, Specifications, Verification Method and Schedule 32. However, referenced documents are only applicable to the NCC provision that references the document.

A proponent undertaking a Performance Solution can use any element or edition of any document, if they help satisfy the Performance Requirements. They do not need to use the documents listed in Schedule 32.

Schedule 32 lists the specific edition of the Standard or other document adopted, including any amendments considered appropriate for Schedule 32, the Deemed-to-Satisfy Provisions, Specifications or Verification Methods. Other editions of (or amendments to) the referenced document are not adopted and have no standing under the NCC.

A primary referenced document may refer to a secondary referenced document. A4G1 stipulates that the secondary referenced document is the edition of the document that existed at the time of publication of the primary referenced document. When another edition of (or amendment to) a secondary referenced document is released, subject to the exemption to A4G1, that edition (or amendment) is not adopted for the purposes of the primary referenced document.

A4G2 means that contractual matters or clauses defining responsibilities of various parties, and matters not appropriate for adoption in the NCC are not included when a document is called up in the NCC.
Introduction to this Part

This Part explains the evidence needed to show that the NCC requirements are met and the solution is “fit for purpose”. It covers the use of materials, products, forms of construction and designs. It details separate requirements for the BCA and PCA.

Examples of evidence to be prepared and retained include certificates, reports, calculations and any other documents or information showing compliance with the NCC requirements.

A5G1 Suitability

[2019: A5.0]

(1) A building and plumbing or drainage installation must be constructed using materials, products, plumbing products, forms of construction and designs fit for their intended purpose to achieve the relevant requirements of the NCC.

(2) For the purposes of (1), a material, product, plumbing product, form of construction or design is fit for purpose if it is—

(a) supported by evidence of suitability in accordance with—

(i) A5G2; and

(ii) A5G3 or A5G4 as appropriate; and

(b) constructed or installed in an appropriate manner.

Explanatory Information:

A5G1 relates to the quality of work and materials needed to construct a building to meet NCC requirements.

This means that—

• all people involved with construction must work skilfully in accordance with good trade practice; and
• all materials must be of a quality to fulfil their function/s within the building.

A5G1 only applies to matters normally covered by the NCC.

While A5G1 outlines quality of work and material demands, sometimes additional conditions may be required by—

• other Commonwealth, State or Territory legislation; and
• contracts that include either specific quality requirements, or requirements for specific materials and the like.

Explanatory Information: Example

Permit authorities would ordinarily not apply A5G1 to such matters as—

• plastering — other than for fire rating, waterproofing of wet areas, and sound insulation; or
• painting — other than that required for weatherproofing an external wall.

When determining which form of evidence will be used, it is important to consider the appropriateness of the evidence, as some forms of evidence may be more suitable to materials and products and others to designs and forms of construction. The requirement to consider appropriateness of the evidence is specified in A5G2(1).
A5G2  Evidence of suitability — Volumes One, Two and Three

[2019: A5.1]

(1) The form of evidence used must be appropriate to the use of the material, product, plumbing product, form of construction or design to which it relates.

(2) Any copy of documentary evidence submitted must be a complete copy of the original certificate, report or document.

Explanatory Information:
For further guidance, refer to the ABCB Handbook for Evidence of Suitability.
All copies of documents provided as evidence must be unabridged copies of the originals. No part can be left incomplete.

A5G3  Evidence of suitability — Volumes One and Two (BCA)

[2019: A5.2]

(1) Subject to A5G5, A5G6 and A5G7, evidence to support that the use of a material, product, form of construction or design meets a Performance Requirement or a Deemed-to-Satisfy Provision may be in the form of any one, or any combination of the following:

(a) A current CodeMark Australia or CodeMark Certificate of Conformity.

(b) A current Certificate of Accreditation.

(c) A current certificate, other than a certificate described in (a) and (b), issued by a certification body stating that the properties and performance of a material, product, form of construction or design fulfil specific requirements of the BCA.

(d) A report issued by an Accredited Testing Laboratory that—
   (i) demonstrates that a material, product or form of construction fulfils specific requirements of the BCA; and
   (ii) sets out the tests the material, product or form of construction has been subjected to and the results of those tests and any other relevant information that has been relied upon to demonstrate it fulfils specific requirements of the BCA.

(e) A certificate or report from a professional engineer or other appropriately qualified person that—
   (i) certifies that a material, product, form of construction or design fulfils specific requirements of the BCA; and
   (ii) sets out the basis on which it is given and the extent to which relevant standards, specifications, rules, codes of practice or other publications have been relied upon to demonstrate it fulfils specific requirements of the BCA.

(f) Another form of documentary evidence, such as but not limited to a Product Technical Statement, that—
   (i) demonstrates that a material, product, form of construction or design fulfils specific requirements of the BCA; and
   (ii) sets out the basis on which it is given and the extent to which relevant standards, specifications, rules, codes of practice or other publications have been relied upon to demonstrate it fulfils specific requirements of the BCA.

(2) Evidence to support that a calculation method complies with an ABCB protocol may be in the form of any one, or any combination of the following:

(a) A certificate from a professional engineer or other appropriately qualified person that—
   (i) certifies that the calculation method complies with a relevant ABCB protocol; and
   (ii) sets out the basis on which it is given and the extent to which relevant standards, specifications, rules, codes of practice and other publications have been relied upon.

(b) Another form of documentary evidence that correctly describes how the calculation method complies with a relevant ABCB protocol.
Applications:
A5G3 is only applicable to NCC Volumes One and Two (BCA).

Explanatory Information:
A5G3 represents the minimum level of documentary evidence needed to show that a material, product, form of construction or design meets the relevant NCC requirements. The evidence can be required by:

- an appropriate authority;
- a party to a construction contract; or
- a person certifying compliance with the NCC.

If a building proponent does not produce exactly what is required, the evidence may be rejected.

It should be noted that design may refer to engineering design, architectural design as well as product and material design.

A5G3(1)(f) allows for the use of alternative forms of documentary evidence to those included in A5G3(1)(a) to (e), as long as they comply with certain specified conditions.

An example of this arises when an authority carries out an inspection of a building site. The inspection alone would not be acceptable as evidence. However, if the authority compiled a written report detailing findings and conclusions from the inspection, then it may comply with the requirements of A5G3(1)(f).

A Product Technical Statement detailing the characteristics and merits of a particular product or system is also an example of another form of documentary evidence.

There is significant reliance by industry on the use of calculation methods, including software programs, for demonstrating compliance with the NCC. While there is no formal recognition of specific methods, A5G3(2) allows suitable evidence to be submitted to demonstrate that a calculation method (including a software program) complies with a relevant ABCB protocol that establishes the characteristics of a suitable calculation method.

Current documentary evidence, such as a certificate or report, containing provision references relating to NCC 2019 remains valid despite amended provision references in NCC 2022. Documentary evidence prepared after the NCC 2022 adoption date is to reflect NCC 2022 provision references.

If under a Deemed-to-Satisfy Provision a building element is required to have an FRL, then A5G3 may be used to provide evidence to show that the FRL has been determined in accordance with Specification 1 and 2.

In the case of a test report from an Accredited Testing Laboratory, the report may be either—

- the test report referred to in clause 2.16.2 of AS 1530.4 (also referred to as a full test report); or
- the regulatory information report referred to in clause 2.16.3 of AS 1530.4 (also referred to as a short-form report).

In both cases the report must be an unabridged copy of the original report. A test certificate referred to in clause 2.16.4 of AS 1530.4 on its own is not suitable for showing compliance with the NCC.

If a proposal uses a Deemed-to-Satisfy Provision that requires a building element to have fire hazard properties, then A5G3 may be used to provide evidence to support the proposal and show that the fire hazard properties have been determined in accordance with A5G6.

Refer to the guidance provided in the Guide to Volume One for further information on fire hazard properties which includes—

- Flammability Index; and
- Spread-of-Flame Index; and
- Smoke-Developed Index; and
- a material’s group number; and
- smoke growth rate index.

The Deemed-to-Satisfy Provisions of the BCA contain a number of provisions requiring a ceiling to have a resistance to the incipient spread of fire to the space above itself. A5G7 sets out the method of determining the incipient spread of fire. The method is based on the method of determining the FRL of a building element and use of the Standard Fire Test.
Evidence of suitability — Volume Three (PCA)

TAS A5G4(1)

(1) Any product that is intended for use in contact with drinking water must comply with the relevant requirements of AS/NZS 4020, verified in the form of either—

(a) A test report provided by an accredited certification body or Accredited Testing Laboratory, in accordance with AS/NZS 4020; or

(b) A WaterMark licence issued in accordance with (2), if it includes compliance with AS/NZS 4020.

(2) Any copper alloy product that is intended for use in contact with drinking water must have a weighted average lead content of no more than 0.25% verified in the form of either—

(a) a test report provided by an Accredited Testing Laboratory, in accordance with NSF/ANSI 372; or

(b) a WaterMark licence issued in accordance with (3), if it includes compliance with NSF/ANSI 372.

(3) A product of a type listed on the WaterMark Schedule of Products is deemed to be fit for its intended purpose if it has a WaterMark Licence issued in accordance with the WaterMark Scheme Rules.

TAS A5G4(34)

(34) A product of a type listed on the Watermark Schedule of Excluded Products requires evidence of suitability in the form of—

(a) a current certificate issued by a certification body stating that the properties and performance of a product can meet the requirements of the PCA; or

(b) a report issued by an Accredited Testing Laboratory that—

(i) demonstrates that the product complies with the relevant requirements of the PCA; and

(ii) sets out the tests the product has been submitted to and the results of those tests and any other relevant information that has been relied upon to demonstrate suitability for use in a plumbing or drainage installation.

(35) Any product that is not covered by (2) or (34) must be subjected to a risk assessment in accordance with the WaterMark Scheme Rules.

TAS A5G4(56)

(56) Evidence to support that a design or system meets the relevant PCA Performance Requirements must be in the form of any one or any combination of the following:

(a) The design or system complies with a Deemed-to-Satisfy Provision.

(b) The design or system is a Performance Solution from a professional engineer or a recognised expert that—

(i) certifies that the design or system complies with the relevant requirements of the PCA; and

(ii) sets out the basis on which it is given and the extent to which relevant standards, specifications, rules, codes of practice or other publications have been relied upon.

(c) Any other form of documentary evidence that—

(i) demonstrates that a design or system complies with the relevant requirements of the PCA; and

(ii) sets out the basis on which it is given and the extent to which relevant standards, specifications, rules, codes of practice or other publications have been relied upon.

Applications:

A5G4 is only applicable to NCC Volume Three (PCA).
Explanatory Information:

A5G4(1) requires any *product* intended for use in contact with *drinking water* to comply with AS/NZS 4020. Compliance is achieved by passing the relevant tests set out in the Standard.

Evidence of compliance must then be provided in accordance with A5G4(1), under which there are two options. The first, at A5G4(1)(a), recognises test reports and certificates that cover compliance with AS/NZS 4020 only. The second, at A5G4(1)(b), recognises *WaterMark Licences* where compliance with AS/NZS 4020 is a requirement of the relevant *product* Standard or WaterMark Technical Specification.

For *products* that are of a type listed on the *WaterMark Schedule of Products*, A5G4(2) requires that these *products* have a *WaterMark Licence*. A *WaterMark Licence* reflects that the *product* has been certified and authorised in accordance with the WaterMark Scheme Rules.

For *products* that are not subject to WaterMark certification (i.e. excluded *products*), evidence that can be used to support that the *product* is fit for its intended purpose is provided in A5G4(3). This may include demonstrating compliance with a *product* specification referenced in the *WaterMark Schedule of Excluded Products*, where one is available.

A5G4(4) provides that any product that is not listed on the *WaterMark Schedule of Products* or the *WaterMark Schedule of Excluded Products* must be subjected to a risk assessment in accordance with the WaterMark Scheme Rules. The risk assessment will determine whether the product in question requires certification and authorisation, or if it should be listed as an “excluded product”. This in turn will determine the form of evidence of suitability applicable to the *product*.

Applications:

Products captured by A5G4(2) include:

(a) *Copper alloy fittings*.
(b) *Stainless-steel braided hoses*.
(c) *Valves (such as valves for isolation, backflow prevention, alteration of pressure and temperature)*.
(d) *Taps and mixers*.
(e) *Water meters*.
(f) *Pumps (for use with cold and heated water services)*.
(g) *Water heaters*.
(h) *Residential water filtration equipment*.
(i) *Water dispensers (such as boiling and cooling units, drinking fountains and bottle fillers)*.

Exemptions:

(1) *Products that are used exclusively for non-drinking uses such as manufacturing, industrial processing, irrigation or any other uses where water is not anticipated to be used for human consumption are excluded from the requirements of A5G4(2)*.

(2) Products excluded by A5G4(2) include:

(i) *Shower heads for bathing and emergency showers, eye wash and/or face wash equipment*.
(ii) *Pumps used for irrigation, fire-fighting or other non-drinking water purposes*.
(iii) *Fire-fighting water services and equipment including residential fire sprinklers*.
(iv) *Appliances, including washing machines and dishwashers*.
(v) *Commercial boilers associated with heating, ventilation and air-conditioning systems*.
(vi) *Sanitary fixtures (such as toilets, cistern inlet valves, bidets, urinals)*.
(vii) *Non-drinking water systems (such as recycled water systems)*.

Explanatory Information: What is WaterMark?

The *WaterMark Certification Scheme* is a mandatory certification scheme for *plumbing* and *drainage products* to ensure that these *products* are fit for purpose and appropriately authorised for use in a *plumbing* or *drainage* system.

The PCA, through Part A5, requires certain *plumbing* and *drainage products* to be certified and authorised for use in a *plumbing* or *drainage* system. These products are certified through the *WaterMark Certification Scheme* and listed on
Governing requirements

The WaterMark Certification Scheme is governed by the WaterMark Scheme Rules, which are available for download from the ABCB website at: www.abcb.gov.au. These rules set out the requirements for risk assessments, evaluation, certification, and the drafting of WaterMark Technical Specifications.

When a product is listed on the WaterMark Schedule of Products then, for it to be certified and authorised, the product must—

- be tested by an Accredited Testing Laboratory; and
- comply with an approved product specification (either a relevant existing product Standard or a WaterMark Technical Specification); and
- be manufactured in accordance with an approved Quality Assurance Program; and
- carry a scope of use.

Products that comply fully with the applicable requirements of the WaterMark Certification Scheme are then eligible to be certified by a WaterMark Conformity Assessment Body and listed on the WaterMark Product Database. Certified products are identifiable by the WaterMark certification trade mark, shown in Figure A5G4 below, that must be displayed on the product upon granting of a WaterMark Licence.

Figure A5G4 (explanatory): WaterMark Certification Scheme Trademarks

A5G5 Fire-resistance of building elements

[2019: A5.4]

Where a Deemed-to-Satisfy Provision requires a building element to have an FRL, it must be determined in accordance with Specifications 1 and 2.

A5G6 Fire hazard properties

[2019: A5.5]

Where a Deemed-to-Satisfy Provision requires a building component or assembly to have a fire hazard property it must be determined as follows:

(a) For average specific extinction area, critical radiant flux and Flammability Index, as defined in Specifications 1 and 2.

(b) For Smoke-Developed Index and Spread-of-Flame Index, in accordance with Specification 3.

(c) For a material’s group number or smoke growth rate index (SMOGRA_RC), in accordance with S7C4(2).

A5G7 Resistance to the incipient spread of fire

[2019: A5.6]

A ceiling is deemed to have a resistance to the incipient spread of fire to the space above itself if—

(a) it is identical with a prototype that has been submitted to the Standard Fire Test and the resistance to the incipient spread of fire achieved by the prototype is confirmed in a report from an Accredited Testing Laboratory that—
   (i) describes the method and conditions of the test and form of construction of the tested prototype in full; and
(ii) certifies that the application of restraint to the prototype complies with the Standard Fire Test; or

(b) it differs in only a minor degree from a prototype tested under (a) and the resistance to the incipient spread of fire attributed to the ceiling is confirmed in a report from an Accredited Testing Laboratory that—

(i) certifies that the ceiling is capable of achieving the resistance to the incipient spread of fire despite the minor departures from the tested prototype; and

(ii) describes the materials, construction and conditions of restraint that are necessary to achieve the resistance to the incipient spread of fire.

### A5G8 Labelling of Aluminium Composite Panels

[2019: A5.7]

An Aluminium Composite Panel must be labelled in accordance with SA TS 5344.
Introduction to this Part

The NCC groups buildings and structures by the purpose for which they are designed, constructed or adapted to be used, rather than by the function or use they are put to, assigning each type of building or structure with a classification. This Part explains how each building classification is defined and used in the NCC.

The building classifications are labelled “Class 1” through to “Class 10”. Some classifications also have sub-classifications, referred to by a letter after the number (e.g. Class 1a).

The technical building requirements for Class 2 to 9 buildings are mostly covered by Volume One of the NCC and those for Class 1 and 10 are mostly covered by Volume Two of the NCC. Volume Three of the NCC covers plumbing and drainage requirements for all building classifications.

A building may have parts that have been designed, constructed or adapted for different purposes. In most cases, each of these parts is a separate classification. A building (or part of a building) may also have more than one such purpose and may be assigned more than one classification.

Governing Requirements

A6G1 Determining a building classification

[2019: A6.0]

(1) The classification of a building or part of a building is determined by the purpose for which it is designed, constructed or adapted to be used.

(2) Each part of a building must be classified according to its purpose and comply with all the appropriate requirements for its classification.

(3) A room that contains a mechanical, thermal or electrical facility or the like that serves the building must have the same classification as the major part or principal use of the building or fire compartment in which it is situated.

(4) Unless another classification is more suitable an occupiable outdoor area must have the same classification as the part of the building to which it is associated.

Exemptions:

(1) For A6G1(1) where a part of a building has been designed, constructed or adapted for a different purpose and is less than 10% of the floor area of the storey it is situated on, the classification of the other part of the storey may apply to the whole storey.

(2) A6G1(3) does not apply to an electricity network substation.

Limitations:

Exemption (1) does not apply where the minor use of a building is a laboratory or a Class 2, 3, or 4b early childhood centre part of a building.

Explanatory Information:

Classification is a process for understanding risks in a building or part, according to its use. It must be correctly undertaken to achieve NCC aims as appropriate to each building in each circumstance.

It is possible for a single building to have parts with different classifications. Part of a building can also have more than one classification. Where there is any conflict between what requirements the part should comply with, the more stringent requirement applies.

Where it is unclear which classification should apply, appropriate authorities have the discretion to decide. They base their decision on an assessment of the building proposal.
They will look at what classification the building most closely resembles. They will also take into account the likely fire load, plus, the likely consequences of any risks to the safety, health and amenity of people using the building.

Appropriate authorities will also look at any relevant court decisions or determinations of the State or Territory body responsible for considering appeals on building classification matters.

It should be noted that appeals body determinations and, in some States and Territories, certain court decisions are usually not precedent creating. Such decisions are determined on a case-by-case basis.

It should also be noted that State and Territory authorities responsible for building regulatory matters may have issued advice, interpretations or guidelines to assist practitioners in applying the correct classification to a building or part. Advice on such matters should be sought from the relevant authority.

Under Exemption (1) to A6G1, if 10% or less of the floor area of a storey is used for a purpose which could be classified differently to the remainder of that storey, that part may be classified as being the same as the remainder. Laboratories and sole-occupancy units in Class 2, 3 or 4 parts are excluded from this concession (see Limitation to A6G1). The reason is that laboratories are considered to have a high fire hazard potential and classifying them with the remainder of the building could, in a majority of cases, endanger occupants of the other parts of the building which have a lower fire hazard potential. Also, the intent is not to allow sole-occupancy units in Class 2, 3 or 4 parts to be regarded as another Class such as Class 6 and then not have any fire or sound insulation between the units and any other classification which may have a high fire load and could endanger the occupants of the Class 2, 3 or 4 part.

If Exemption (1) to A6G1 is used, it should be remembered that it will still be necessary to use the occupant numbers in Volume One Table D2D18 for the particular use of the area. Likewise, the lighting and equipment levels, people occupancy and load profiles for the area of minor use for the purposes of Volume One Section J must be in accordance with the use of the area.

If the storey has a very large floor area, the 10% or less concession area may also be large, even though the rest of the building is classifiable as a building which ordinarily has a lower risk potential. An example of the application of this area concession could be as follows:

- If a single storey factory has an office that takes up 8% of the whole storey’s floor area, the entire building (including the office) can be classified as being Class 8.
- However, if that office area takes up 12% of the storey’s floor area, that area must be classified as Class 5, and the remainder of the building as Class 8.

Under A6G1(3) a plant room, machinery room, lift motor room or boiler room, have the same classification as the part of the building they are in. These kinds of rooms do not need to be ancillary or subordinate to the part of the building they are in, that is, the 10% criterion is not applicable.

There are specific provisions for these kinds of rooms. For example, Volume One Section C requires some of them to be fire separated from the remainder of the building (e.g. see C3D14 with regard to elements of the electricity supply system).

### A6G2 Class 1 buildings

[2019: A6.1]

1. A Class 1 building is a dwelling.
2. Class 1 includes the following sub-classifications:
   a. Class 1a is one or more buildings, which together form a single dwelling including the following:
      i. A detached house.
      ii. One of a group of two or more attached dwellings, each being a building, separated by a fire-resisting wall, including a row house, terrace house, town house or villa unit.
   b. Class 1b is one or more buildings which together constitute—
      i. a boarding house, guest house, hostel or the like that—
         A. would ordinarily accommodate not more than 12 people; and
         B. have a total area of all floors not more than 300 m² (measured over the enclosing walls of the building or buildings); or
      ii. four or more single dwellings located on one allotment and used for short-term holiday accommodation.
Governing requirements

Figure A6G2a: Identification of Class 1 buildings

Class 1 single dwelling (may be one or more storeys)

Common wall between Class 1 and Class 2 buildings

Class 2 building containing two or more separate dwellings located one above the other

Figure A6G2b: Typical Class 1 building configurations

(a) 3 Class 1 buildings on 3 separate allotments

(b) 3 Class 1 buildings on 2 separate allotments

Plan view
Limitations:
For A6G2, a Class 1 building cannot be located above or below another dwelling or another Class of building, other than a *private garage*.

Explanatory Information:
Class 1 buildings are covered in Volumes Two and Three of the NCC. Class 1 buildings are not located above or below another dwelling, or another class of building other than a *private garage*.

A *sole-occupancy unit* used for residential purposes located over another *sole-occupancy unit* used for residential purposes will always be a Class 2 or Class 3 building (depending on the circumstances). It cannot be a Class 1 building.

A single Class 1 dwelling can be made up of more than one building. For example, it may include what is ordinarily called a house, plus one or more habitable ‘outbuildings’ such as sleepouts. Note that a habitable building such as a sleepout cannot be classified as a Class 10 building.

The height or number of storeys of a Class 1 building makes no difference to its classification.

Class 1b buildings used for short-term holiday accommodation include cabins in caravan parks, tourist parks, farm stay, holiday resorts and similar tourist accommodation. This accommodation itself is typically rented out on a commercial basis for short periods and generally does not require the signing of a lease agreement. Short-term accommodation can also be provided in a boarding house, guest house, hostel, bed and breakfast accommodation or the like.

Unlike a Class 1b building described in A6G2(2)(a), a Class 1b building described in A6G2(2)(b) does not have any *floor area* limitation. Therefore, if 4 or more single dwellings are located on the one allotment and used for short-term holiday accommodation, each single dwelling would be classified as a Class 1b building regardless of the *floor area* of each dwelling or the combined *floor area* of all of the dwellings.

See also Volume One D4D2(3) which contains an explanation of what is considered be “one allotment”.

The Class 1b classification can attract concessions applicable to Class 3 buildings. These concessions allow people to rent out rooms in a house, or run a bed and breakfast, without having to comply with the more stringent Class 3 requirements. The reasoning is that the smaller size of the building and its lower number of occupants represents reduced fire risks.

Apart from their use, the primary difference between Class 1a and Class 1b buildings is that the latter is required to have a greater number of smoke alarms and in some circumstances, access and features for people with a disability.
A6G3 Class 2 buildings

(1) A Class 2 building is a building containing two or more *sole-occupancy units*.

(2) Each *sole-occupancy unit* in a Class 2 building must be a separate dwelling.

Explanatory Information:

A Class 2 building is one that includes more than one dwelling, each of which is generally solely occupied by one or more people to the exclusion of others.

Such buildings must not be otherwise classified as a Class 1 or Class 3 building or Class 4 part. See explanatory Figure A6G3a for a typical configuration of Class 1 and Class 2 buildings.

Where a sole-occupancy residential unit is located above another sole-occupancy residential unit, the building containing the units can be either a Class 2 or a Class 3 building, depending on the other circumstances of the building proposal.

Class 2 buildings can be single *storey* attached dwellings. Where there is any common space below such dwellings, they are Class 2 (and cannot be Class 1) irrespective of whether the space below is a *storey* or not (see explanatory Figure A6G3b).

Class 2 buildings can be attached to buildings of another Class. The attached Class 2 buildings need not be attached to one another, and need not be more than a single *storey*.

When two or more dwellings are attached to another Class, they cannot be Class 4 parts, as any building can only contain one Class 4 dwelling.

Figure A6G3a (explanatory): Section showing a typical configuration of Class 1 and Class 2 buildings (with non-combustible roof coverings)
A6G4  Class 3 buildings

[2019: A6.3]

(1) A Class 3 building is a residential building providing long-term or transient accommodation for a number of unrelated persons.

(2) Class 3 buildings include the following:
   
   (a) A boarding house, guest house, hostel, lodging house or backpacker accommodation.
   
   (b) A residential part of a hotel or motel.
   
   (c) A residential part of a school.
   
   (d) Accommodation for the aged, children, or people with disability.
   
   (e) A residential part of a health-care building which accommodates members of staff.
   
   (f) A residential part of a detention centre.
   
   (g) A residential care building.

Limitations:

For A6G4, a Class 3 building is not a Class 1 or 2 building but may be a mixture of Class 3 and another Class.

Explanatory Information:

Class 3 buildings provide accommodation for unrelated people. The length of stay is unimportant.

Some exceptions to this classification include: certain bed and breakfast accommodation, boarding houses, guest houses, hostels, or lodging houses and the like which fall within the concession provided for Class 1b buildings.

Also, any sized building can be classified as Class 1 or Class 2 if it is used to house any number of unrelated people who jointly own or rent it, or share it on a non-rental basis with an owner or tenant.

It is not unusual for a manager’s, owner’s or caretaker’s dwelling attached to a Class 3 building to be thought of as a Class 4 part of the Class 3 building. However, a Class 4 part of a building can only be part of a Class 5-9 building.

Accordingly, such dwellings are either classified as Class 1, Class 2 or Class 3, depending on the circumstances of the building proposal. However, a building could be a mixture of Class 3 and another Class.

Class 3 buildings include—

- the residential parts of hotels and motels; and
• hotel or motel caretakers', managers' or owners' flats, noting that under certain circumstances such dwellings could be Class 1, Class 2 or Class 3 buildings; and
• dormitory accommodation, in schools or elsewhere, noting that a dormitory is generally (but not always) considered to be a sole-occupancy unit; and
• bed and breakfast accommodation, a boarding house, guest house, hostel, or lodging house; and
• backpackers' accommodation; and
• a building which houses elderly people or other people who require special care. (In some States or Territories it is not acceptable for a Class 1b building to be used to house elderly people or other people who require special care - it is recommended the local building regulatory body be consulted.); and
• workers’ quarters, including shearers’ or fruit pickers’ accommodation, or hotel workers’ accommodation.

A6G5

Class 4 buildings

[2019: A6.4]

Class 4 is a dwelling in a Class 5, 6, 7, 8 or 9 building if it is the only dwelling in the building.

Explanatory Information:

Class 4 classification applies to some types of accommodation located within a Class 5-9 building. The most common include a caretaker’s flat within a building; and accommodation over or otherwise connected to a shop.

A Class 4 part cannot be located within a Class 1, Class 2 or Class 3 building. There can only be one Class 4 dwelling in a building. If there are two or more dwellings, they are Class 1, Class 2, or possibly Class 3. These Class 1, Class 2 or Class 3 parts need not be attached to one another, nor be more than a single storey.

Where a Class 4 part of a building is rented out for accommodation purposes, it retains its Class 4 classification. However, if any other part of the principal building is used for accommodation, for example, the attached shop is converted into an additional flat, both flats become classifiable as Class 2 or, depending on their use, possibly Class 3.

A6G6

Class 5 buildings

[2019: A6.5]

A Class 5 building is an office building used for professional or commercial purposes.

Explanatory Information:

Class 5 buildings include professional chambers or suites, lawyers’ offices, government offices, advertising agencies and accountants’ offices.

NSW A6G7

SA A6G7

A6G7

Class 6 buildings

[2019: A6.6]

(1) A Class 6 building is a shop or other building used for the sale of goods by retail or the supply of services direct to the public.

(2) Class 6 buildings include the following:
   (a) an eating room, cafe, restaurant, milk or soft-drink bar.
   (b) a dining room, bar area that is not an assembly building, shop or kiosk part of a hotel or motel.
   (c) a hairdresser’s or barber’s shop, public laundry, or undertaker’s establishment.
   (d) market or sale room, showroom, or service station.
Explanatory Information:
A Class 6 building is a building where goods or services are directly sold or supplied to the public. Examples of a Class 6 building may include—

- a place where food or drink may be purchased such as a café or restaurant; or
- a dining room, bar area that is not an assembly building, shop or kiosk part of a hotel or motel; or
- a hairdresser’s or barber’s shop, public laundry, veterinarian; or
- supermarket or sale room, florist, showroom, or service station.

Service stations are Class 6 buildings. These are outlets used for the servicing of cars and the selling of fuel or other goods. The expression ‘service station’ is not intended to cover buildings where panel beating, auto electrical, muffler replacement, tyre replacement and the like are solely carried out. Such buildings should be classified as Class 6, Class 7 or Class 8 buildings as the appropriate authority sees fit.

A6G8 Class 7 buildings

(1) A Class 7 building is a storage-type building.
(2) Class 7 includes the following sub-classifications:
   (a) Class 7a — a carpark.
   (b) Class 7b — a building that is used for storage, or display of goods or produce for sale by wholesale.

Explanatory Information:
There are three basic types of Class 7 building. The first is a carpark as defined in the NCC. The second is a building used for storage, often referred to as a ‘warehouse’. The third is a building used for the display of goods or produce for sale by wholesale. ‘Wholesale’ means sale to people in the trades or in the business of ‘on-selling’ goods and services to another party (including the public).

A6G9 Class 8 buildings

(1) A Class 8 building is a process-type building.
(2) Class 8 buildings include the following:
   (a) A laboratory.
   (b) A building in which the production, assembling, altering, repairing, packing, finishing, or cleaning of goods or produce for sale takes place.

Explanatory Information:
The most common way to describe a Class 8 building is as a ‘factory’. However, this can give a simplistic impression of the types of building which can fall within this classification.

For example—
- some laboratories, despite their often small size, have been included as Class 8 buildings principally because of their high fire hazard; and
- buildings used for altering or repairing (except service stations, which are specifically included in A6G7 as Class 6 buildings); and
- potteries; and
- food manufacturers (but not restaurants, which are specifically included in A6G7 as Class 6 buildings); and
- buildings used for the packing or processing of produce, such as a farm or horticultural building.
A6G10  Class 9 buildings  [2019: A6.9]

(1) A Class 9 building is a building of a public nature.

(2) Class 9 includes the following sub-classifications:

(a) Class 9a — a *health-care building* including any parts of the building set aside as laboratories, and includes a *health-care building* used as a *residential care building*.

(b) Class 9b — an *assembly building* including a trade workshop or laboratory in a primary or secondary *school*.

(c) Class 9c — a *residential care building*.

Exemptions:
A6G10(2)(b) excludes any parts of the building that are of another Class.

Explanatory Information:

Class 9a buildings are *health-care buildings*, including day-care surgeries or procedure units and the like. See definition of *health-care building*. Laboratories that are part of a Class 9a building are Class 9a, despite the general classification of laboratories as Class 8 buildings.

These buildings can include—

- Class 9b buildings are *assembly buildings*.
- theatres, cinemas and halls, churches, schools, early childhood centres, kindergartens, preschools and child-minding centres; and
- indoor cricket, tennis, basketball centres and sport stadiums; and
- nightclubs, discotheques, bar areas providing live entertainment and/or containing a dance floor, public halls, dance halls and other places of entertainment; and
- snooker halls; and
- bus and railway stations.

Regarding the Exemption to A6G10(2)(b), a building could be a mixture of Class 9b and another Class, or a Class 9b building could contain parts that are of another Class, but be taken as a Class 9b building because of A6G1 Exemption (1).

Class 9c buildings are *residential care buildings* that may contain residents who have various care level needs.

The Class 9c classification recognises that many residents progress through a continuum of care needs from low to high. Many older people enter residential care with low care needs (typically Class 3 facilities) but, as they age, require higher levels of care. In the past, such progression often necessitated the transfer of a hostel resident (Class 3) to a nursing home (Class 9a). This frequently had negative consequences for the health and well-being of the resident, for whom the hostel accommodation was home. It also led, at times, to the separation of couples with differing care needs.

Building designers should note that Class 3 buildings include hostels for the accommodation of the aged, and Class 9a buildings include nursing homes. It is important to be aware, however, that construction of Class 3 or 9a buildings may restrict the options available to the operators of a facility in relation to the profile of the residents they wish to accommodate. Where the potential exists for residents of varying care needs to be accommodated, consideration of the Class 9c provisions may be appropriate. The Class 9c classification allows for any mix of low and high care residents and is intended to allow the mix to change as the residents’ care needs change over time, without the need to obtain any further consent or approval from the *appropriate authority*.

Multi-care level facilities are for residents who may require the full range of care services outlined by the Aged Care Act. Hence, it is not intended to restrict the resident type and provides maximum flexibility for service providers, residents and the community.

The NCC provisions for Class 9c buildings are based on minimal on duty on-site staff being available at any time. However, it is recognised that the staff numbers vary throughout the course of any one day, due to the care needs of the residents and the functioning of the facility. It is also recognised that the specific care needs of the residents may result in a greater minimum number of staff.
A6G11 Class 10 buildings and structures

[2019: A6.10]

(1) A Class 10 building is a non-habitable building or structure.

(2) Class 10 includes the following sub-classifications:
   (a) Class 10a is a non-habitable building including a private garage, carport, shed or the like.
   (b) Class 10b is a structure that is a fence, mast, antenna, retaining wall or free-standing wall or swimming pool or the like.
   (c) Class 10c is a private bushfire shelter.

Explanatory Information:
Class 10a buildings are non-habitable buildings. See Figure A6G11 for an indication of some Class 10 building configurations.

Class 10b structures are non-habitable structures. There is no requirement for Class 10 buildings to be appurtenant to a building of any other Class, for example, a small shed standing on its own on an allotment and a toilet block in a park.

A habitable ‘outbuilding’ which is appurtenant to another building is generally part of that building. Again, habitable ‘outbuildings’ cannot be classified as Class 10 buildings.

Typical outbuilding classifications include the following:
- A sleepout on the same allotment as a Class 1 building is part of the Class 1 building.
- A detached entertainment room on the same allotment as a Class 1 building, perhaps associated with a swimming pool, is part of the Class 1 building.
- A small toolshed, used for trade-related hobbies for non-commercial purposes or home repairs, on the same allotment as a Class 1 building, would be classified as a Class 10 building.

Provisions relating to Class 10c structures are only intended to address private bushfire shelter associated with a single Class 1a dwelling. These provisions are contained in Volume Two of the NCC.

Some States or Territories may exempt some Class 10 buildings or structures (often on the basis of height or size) from the need to have a building permit. Queries on this matter should be referred to the State or Territory body responsible for regulatory matters.

Figure A6G11 (explanatory): Examples of Class 10 buildings and structures
A building (or part of a building) may be designed, constructed or adapted for multiple purposes and have more than one classification.

**Applications:**
For A6G12, a building (or part of a building) must comply with all the relevant requirements that apply to each of the classifications for that building (or part of a building).

**Explanatory Information: Difficult classifications — Class 2 or Class 3?**
There is a fine line between a Class 2 building containing apartments or flats and a Class 3 motel building with units containing bathroom, laundry and cooking facilities, which may both be made available for short term holiday rental. When does a Class 3 motel unit become a Class 2 holiday flat and vice versa?

In general, an assessment will be based on the most likely use of the building by appropriate authorities. Class 3 buildings, where the occupants are generally unfamiliar with the building and have minimum control over the safety of the building, represent a higher risk level and therefore require higher safety levels. In a case where the classification is unclear, a decision should be made according to the perceived risks inherent in the use of the building.

**Explanatory Information: Difficult classifications — Class 6 or Class 7?**
Class 7 buildings include those used to sell goods on the wholesale market, whereas Class 6 buildings are used to sell goods to the public.

Some establishments claim to sell goods to both the wholesale and retail markets. As a rule, however, if the general public has access to the building, it is considered a ‘shop’, and therefore a Class 6 building.

**Explanatory Information: Difficult classifications — Hotel bars: Class 6 or 9b?**
As can be seen from the definition of a Class 6 building, it includes a hotel bar which is not an assembly building. The bar includes the bar area and associated standing and seating areas. This clarifies that the bar extends beyond the serving area to include standing and sitting areas where patrons may drink alcohol or other beverages and consume food. The exclusion of an assembly building means that a bar providing live entertainment or containing a dance floor is not considered to be Class 6, it must be considered as Class 9b. However, when that use is minor compared with the remainder of the bar, such as a piano bar or the like where patrons only listen to music and there is no dance floor, the appropriate authority should exercise judgement on the predominant use and therefore the appropriate classification of the bar.

A Class 9b building is an assembly building which is defined to include a building where people may assemble for entertainment, recreational or sporting purposes.

A building may have more than one classification (see A6G12).

**Explanatory Information: Buildings used for farming purposes**
Buildings used for farming-type purposes are often very diverse in nature, occupancy, use and size. In some States or Territories, appropriate authorities may classify farm buildings as Class 10a, which covers non-habitable buildings. They would only make this decision if a classification of Class 7 or Class 8 would not be more appropriate.

When making their decision they consider the building’s size, purpose, operations and the extent to which people are employed in the building. For example, it may be appropriate to classify a shed which is used to store a tractor as a Class 10a building.

The NCC has definitions of farm building and farm shed which are certain Class 7 and 8 buildings used for farming.
purposes. Concessions to specific Deemed-to-Satisfy Provisions apply to farm buildings and farm sheds in recognition of their often low risk features, and it is recommended that reference is made to the definitions of farm building and farm shed for further guidance which may assist determination of an appropriate NCC classification.

For example, if people are likely to be employed to stack materials/produce in a storage building or remove materials/produce from a storage building then a classification of Class 7b may be appropriate. Depending upon whether the criteria in the definition of farm shed or farm building have been met, the associated Deemed-to-Satisfy Provisions in NCC Volume One Part I3 may apply.

Similarly if people are likely to be employed to pack or process materials/produce within a building, or employed to feed, clean or collect produce from animals or plants within a building then a classification of Class 8 may be appropriate. Depending upon whether the criteria in the definition of farm shed or farm building have been met, the associated Deemed-to-Satisfy Provisions in NCC Volume One Part I3 may apply.

However identification of low fire load, low occupant risk and low risk of fire spread should not be used as justification for choosing a less stringent building classification for a building under the Deemed-to-Satisfy Provisions. For example, if the intended use of a building is to grow or store a large amount of tomatoes, such as a large greenhouse, and there is likely to be only one to two persons in the building at any time, it is considered inappropriate to classify the building as a Class 10a under the Deemed-to-Satisfy Provisions and a classification of Class 7 or Class 8 would be more appropriate.

The Deemed-to-Satisfy Provisions for a Class 7 or Class 8 farm building or farm shed do not prevent the ability to consider or develop a Performance Solution for a particular building where the requirements may not be considered appropriate or are viewed as too stringent. Similarly if a Class 7 or 8 building used for farming purposes does not meet all the criteria to be considered a farm building or farm shed under the Deemed-to-Satisfy Provisions, this would not limit the ability to develop a Performance Solution which could contain features similar to those allowed under the Deemed-to-Satisfy Provisions for farm buildings or farm sheds.

For example, if a Class 8 commercial poultry building meets all the criteria to be considered a farm building under the Deemed-to-Satisfy Provisions other than the maximum floor area criteria, a Performance Solution could be developed to demonstrate that the concessions for a farm building under the Deemed-to-Satisfy Provisions are appropriate.

In regards to a farm building or farm shed where the purpose of the building is to park farm vehicles when not in use, as well as perhaps clean or polish the vehicle(s), it may be appropriate that this type of building is classified as a Class 7a.

However, a number of farm buildings and farm sheds are often not only used for the storage of farm vehicles, but to store supplies such as fuel, grain or hay. A Class 7a classification may still be appropriate where the majority of the shed’s space is intended to be designated for the parking of vehicles. However, it may be more appropriate to classify some types of buildings as Class 7b, rather than Class 7a where a mixed use shed is intended.

Under A6G12 each part of a building (including the entire building) may have more than one classification. This means, for example, that it is permissible to classify part of a building as a Class 6/7 building, or a Class 5/6 building, or whatever is appropriate.

It is expected that this approach may be taken by a builder who is uncertain of what the precise use of a building will be after its sale, or to maximise the flexibility of the building’s use.

Under the Application to A6G12, where a building has more than one classification the more stringent Class requirements will apply.
Introduction to this Part

This Part explains how multiple buildings can be considered as a united building. Where adjacent buildings are joined through openings in walls, they need not meet additional requirements if they jointly comply with the NCC as a single building.

A7G1  United buildings

Buildings are deemed united when two or more buildings adjoining each other are connected and used as one building.

Applications:

(1) For A7G1, two or more buildings are a united building if they are connected through openings in the walls dividing them and together comply with all the requirements of the NCC as though they are a single building.

(2) A7G1 only applies to Class 2 to 9 buildings.

A7G2  Alterations in a united building

If, after alterations or any other building work, two or more of the buildings in A7G1 cease to be connected through openings in the dividing walls, each of those buildings not now connected must comply with all the requirements for a single building.

Explanatory Information:

It is not unusual for authorities to receive plans proposing the connecting of two or more buildings. Connecting buildings could be achieved by breaking openings through walls, or by joining the buildings by a tunnel, bridge or covered walkway. When connected, if the buildings jointly comply with all the requirements of the NCC applying as if they were a single building, they become a united building.

United buildings are not required to comply with additional NCC provisions. For example, any new openings do not require any form of fire protection not required of a single building.

Note, however, an external wall, which as a result of an interconnection becomes an internal wall, must comply with the requirements for an internal wall.

Interconnected buildings that do not jointly comply with all the requirements applicable to a single building, remain as separate buildings.

This raises the possible need for fire doors, or other forms of protection to be fitted to connecting openings.

Explanatory Information: Multiple allotments or ownership

The NCC does not concern itself with actually prohibiting or permitting the uniting of buildings in separate ownership or on separate allotments. Such matters are dealt with by the relevant local bodies.

Explanatory Information: Example of connection by bridge

In this example, Building A is connected to Building B by bridge C. There are four different options for designing such a proposal.
The first is a united building:
A, B and C are considered as a single structure and comply with the NCC.

The second is three separate buildings:
A, B and C are a fire-source feature to each of the others, and are separated by fire walls with the openings protected at the points of connection. In this case, C may require independent support and separate egress to a road or open space, that is not through Buildings A or B. In this case, attention should also be paid to the length of the bridge, as regards distance of travel to an exit.

The third option is the bridge as a portion of Building A:
In this option, A and C are one building, meeting all requirements of the NCC as a single or united building. B is a separate building, with suitable fire separation, including fire-doors at the point of interconnection. Bridge C could be supported off Building A, but not off Building B.

The fourth option is having the bridge as a portion of Building B
In this option, B and C are one building, meeting all requirements of the NCC as a single or united building. A is a separate building, with suitable fire separation, including fire doors at the point of interconnection. Bridge C could be supported off Building B, but not off Building A.

In some cases, C will link A and B across a public road, including laneways and the like. Special approvals may be required from various appropriate authorities. However, in such cases—

- if C is supported by means other than off A and B, such support will generally only be permitted if there is no obstruction of the public road; and
- care will need to be taken in calculating the distance of travel to an exit if travel is required to be over C and the road is wide; and
- fire-separation may be necessary at each end of the bridge.
- If the last stipulation is the case, the following matters need consideration:
  - The bridge would probably need to be of fire-rated construction because combustible construction could provide a ready path for the transfer of fire, and non-combustible construction could, in a major fire, distort and collapse onto the road.
  - The designer needs to take care that the bridge does not negate the fire separation between the storeys of the building.
**Introduction to this Part**

This Part includes the quantified metrics that must be used to interpret the fire safety Performance Requirements listed in A8G1 that are not quantified or say to the degree necessary. The degree necessary is the degree that achieves the requirements of this part.

**Governing Requirements**

**A8G1 Application of Part**

(1) A8G2 of this Part applies to the interpretation of Performance Requirements C1P1, C1P2, C1P3, C1P4, C1P5, C1P6, C1P7, C1P8, C1P9, D1P4, D1P5, D1P6, D1P7, E1P1, E1P2, E1P3, E1P4, E1P6, E2P1, E2P2, E3P2, E4P1, E4P2, E4P3, G4P1, G4P2, G4P3, and G4P4.

(2) A8G3 of this Part applies to the interpretation of Performance Requirements C1P1, C1P2, C1P3, C1P8, C1P9, and E1P4.

(3) This Part does not apply where—
   (a) a Performance Solution is achieved by a demonstrating that the solution is at least equivalent to the Deemed-to-Satisfy Provisions in accordance with A2G2(1)(b); or
   (b) the Assessment Method used to assess a Performance Solution is shown to comply with the relevant Performance Requirements in accordance with A2G2(2)(d).

**A8G2 Fire safety**

As a result of a fire occurring within a building, the risk of exposure of occupants to untenable conditions must not exceed the values provided in Table A8G2a and Table A8G2b, with consideration of—

(a) hazards, building characteristics and occupant characteristics including—
   (i) function or use of the building; and
   (ii) fire load; and
   (iii) potential fire intensity; and
   (iv) height of the building; and
   (v) number of storeys; and
   (vi) location in alpine areas; and
   (vii) proximity to other property; and
   (viii) size of any fire compartment/ floor area; and
   (ix) other elements providing structural support; and
   (x) number, mobility and other occupant characteristics; and
   (xi) travel distance; and
   (xii) exit above and below ground; and

(b) prevention/intervention measures against hazards as applicable including—
   (i) control of linings, materials and assemblies to maintain tenable conditions for evacuation; and
   (ii) occupant intervention using firefighting equipment (fire hose reels and fire extinguishers); and
(iii) automatic fire suppression; and
(iv) fire brigade intervention, including—
   (A) fire brigade access; and
   (B) fire hydrants; and
   (C) fire control centres; and
   (D) automatic notification of fire brigade; and
   (E) emergency lifts; and

(c) means of managing the consequences, including—
   (i) maintaining building structural stability; and
   (ii) avoiding spread of fire to exits; and
   (iii) protection from spread of fire and smoke to allow for orderly evacuation as appropriate or as part of defend in place strategies or provisions of temporary refuges for occupants requiring assistance to evacuate; and
   (iv) behaviour of concrete external walls in fire; and
   (v) barrier protection from high hazard service equipment; and
   (vi) protection of emergency equipment; and
   (vii) fire protection of openings and penetrations; and
   (viii) provision of exits; and
   (ix) construction of exits; and
   (x) provision of fire isolated exits; and
   (xi) provisions for paths of travel to, through and from exits; and
   (xii) evacuation lifts; and
   (xiii) automatic warning for sleeping occupants; and
   (xiv) safe evacuation routes; options for consideration include one or more of the following if necessary:
      (A) smoke detection; and
      (B) smoke management systems; and
      (C) automatic suppression; and
   (xv) visibility in an emergency including emergency lighting; and
   (xvi) identification of exits including exit signage; and
   (xvii) emergency warning and intercom systems.

Table A8G2a: **Allowable individual risk of exposure to untenable conditions**

<table>
<thead>
<tr>
<th>Building Class Group</th>
<th>Individual risk per annum (lower tolerable limit)</th>
<th>Individual risk per annum (upper tolerable limit)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Residential/care (building classification 2, 3, 4, 9a or 9c)</td>
<td>$5.0 \times 10^{-6}$</td>
<td>$5.0 \times 10^{-4}$</td>
</tr>
<tr>
<td>Other classes (building classification 5, 6, 7a, 7b, or 9b)</td>
<td>$1.0 \times 10^{-5}$</td>
<td>$1.0 \times 10^{-4}$</td>
</tr>
</tbody>
</table>

Table A8G2b: **Allowable societal risk of exposure to untenable conditions**

<table>
<thead>
<tr>
<th>Number of people exposed to untenable conditions</th>
<th>Societal risk per annum (lower tolerable limit)</th>
<th>Societal risk per annum (upper tolerable limit)</th>
</tr>
</thead>
<tbody>
<tr>
<td>≥5</td>
<td>$8.9 \times 10^{-7}$</td>
<td>$8.9 \times 10^{-5}$</td>
</tr>
<tr>
<td>≥10</td>
<td>$3.2 \times 10^{-7}$</td>
<td>$3.2 \times 10^{-5}$</td>
</tr>
<tr>
<td>≥20</td>
<td>$1.1 \times 10^{-7}$</td>
<td>$1.1 \times 10^{-5}$</td>
</tr>
</tbody>
</table>
Explanatory Information:

If the lower tolerable limits (individual and societal) are not exceeded by the proposed Performance Solution the individual and societal risk criteria can be considered to be satisfied.

If the upper tolerable limits (individual or societal) are exceeded by the proposed Performance Solution the individual or societal risk criteria have not been satisfied and modifications to the proposed solution will be required.

If the individual and/or societal risks presented by the proposed Performance Solution lie between the lower and upper allowable risks the proposed Performance Solution can be considered to be satisfactory if it can be demonstrated that the individual and/or societal risk presented by the Performance Solution is less than or equal to that presented by a similar Deemed-to-Satisfy compliant reference building that is considered to represent a tolerable risk.

A8G3 Spread of fire

(1) A building must avoid the spread of fire between buildings such that:

(a) the probability of a reportable fire in a building causing heat fluxes greater than the values listed Table A8G3a must not exceed 0.001 at the stated distance from the boundary on an adjacent allotment or at the distances between buildings on the same allotment, and

(b) the probability of a building not being able to withstand the heat flux in Table A8G3a for a period of 30 minutes must not exceed 0.01; and

(c) the probability that the external façade of a building cannot withstand the following exposures from reportable fires must not exceed 0.001:

(i) Flames venting through an opening from an enclosure fire within the building.

(ii) Burning items adjacent to the structure such as a vehicle, waste bin, or collection of combustible rubbish depending on the use and access to adjacent areas.

(iii) A fire occurring on a balcony.

(2) A building must avoid the spread of fire within the building such that when a reportable fire occurs, the probability of fire spread does not exceed—

(a) 0.01 to spread outside of a sole-occupancy unit for Class 2, 3 and 4 buildings; and

(b) 0.01 to spread between storeys; and

(c) the values in Table A8G3b.

S1C1 Scope

This Specification sets out the procedures for determining the FRL of building elements.

S1C2 Rating

A building element meets the requirements of this Specification if—

(a) it is listed in, and complies with Tables S1C2a to S1C2n of this Specification; or

(b) it is identical with a prototype that has been submitted to the Standard Fire Test, an equivalent or more severe test, and the FRL achieved by the prototype without the assistance of an active fire suppression system is confirmed in a report from an Accredited Testing Laboratory which—

(i) describes the method and conditions of the test and the form of construction of the tested prototype in full; and

(ii) certifies that the application of restraint to the prototype complied with the Standard Fire Test; or

(c) it differs in only a minor degree from a prototype tested under (b) and the FRL attributed to the building element is confirmed in a report from an Accredited Testing Laboratory which—

(i) certifies that the building element is capable of achieving the FRL despite the minor departures from the tested prototype; and

(ii) describes the materials, construction and conditions of restraint which are necessary to achieve the FRL; or

(d) it is designed to achieve the FRL in accordance with—

(i) AS/NZS 2327, AS 4100 and AS/NZS 4600 if it is a steel or composite structure; or

(ii) AS 3600 if it is a concrete structure; or

(iii) AS 1720.4 if it is a timber element other than fire-protected timber; or

(iv) AS 3700 if it is a masonry structure; or

(e) the FRL is determined by calculation based on the performance of a prototype in the Standard Fire Test and confirmed in a report in accordance with S1C3; or

(f) for fire-protected timber, it complies with Specification 10 where applicable.

</tbody>
</table>
If the FRL of a building element is determined by calculation based on a tested prototype—

(a) the building element may vary from the prototype in relation to—
   (i) length and height if it is a wall; and
   (ii) height if it is a column; and
   (iii) span if it is a floor, roof or beam; and
   (iv) conditions of support; and
   (v) to a minor degree, cross-section and components; and

(b) the report must demonstrate by calculation that the building element would achieve the FRL if it is subjected to the regime of the Standard Fire Test in relation to—
   (i) structural adequacy (including deflection); and
   (ii) integrity; and
   (iii) insulation; and

(c) the calculations must take into account—
   (i) the temperature reached by the components of the prototype and their effects on strength and modulus of elasticity; and
   (ii) appropriate features of the building element such as support, restraint, cross-sectional shape, length, height, span, slenderness ratio, reinforcement, ratio of surface area to mass per unit length, and fire protection; and
   (iii) features of the prototype that influenced its performance in the Standard Fire Test although these features may not have been taken into account in the design for dead and live load; and
   (iv) features of the conditions of test, the manner of support and the position of the prototype during the test, that might not be reproduced in the building element if it is exposed to fire; and
(v) the design load of the building element in comparison with the tested prototype.

S1C4  Interchangeable materials

[2019: Sch. 5: 4]

(1) Concrete and plaster — An FRL achieved with any material of Group A, B, C, D or E as an ingredient in concrete or plaster, applies equally when any other material of the same group is used in the same proportions:
   (a) Group A: any portland cement.
   (b) Group B: any lime.
   (c) Group C: any dense sand.
   (d) Group D: any dense calcareous aggregate, including any limestone or any calcareous gravel.
   (e) Group E: any dense siliceous aggregate, including any basalt, diorite, dolerite, granite, granodiorite or trachyte.

(2) Perlite and vermiculite — An FRL achieved with either gypsum-perlite plaster or gypsum-vermiculite plaster applies equally for each plaster.

S1C5  Columns covered with lightweight construction

[2019: Sch. 5: 5]

If the fire-resisting covering of a steel column is lightweight construction, the construction must comply with Volume One C2D9 and C4D17.

S1C6  Non-loadbearing elements

[2019: Sch. 5: 6]

If a non-loadbearing element is able to be used for a purpose where the Deemed-to-Satisfy Provisions prescribe an FRL for structural adequacy, integrity and insulation, that non-loadbearing element need not comply with the structural adequacy criteria.
S2C1  **Scope**

This Specification sets out the descriptions of elements referred to in Tables S1C2a to S1C2n of Specification 1.

S2C2  **Mortar for masonry**

Masonry units of ashlar, calcium silicate, concrete or fired clay (including terracotta blocks) must be laid in cement mortar or composition mortar complying with the relevant provisions of AS 3700.

S2C3  **Gypsum blocks**

Gypsum blocks must be laid in gypsum-sand mortar or lime mortar.

S2C4  **Gypsum-sand mortar and plaster**

Gypsum-sand mortar and gypsum-sand plaster must consist of either—

(a) not more than 3 parts by volume of sand to 1 part by volume of gypsum; or

(b) if lime putty is added, not more than 2.5 parts by volume of sand to 1 part by volume of gypsum and not more than 5% of lime putty by volume of the mixed ingredients.

S2C5  **Gypsum-perlite and gypsum-vermiculite plaster**

Gypsum-perlite or gypsum-vermiculite plaster must be applied—

(a) in either one or 2 coats each in the proportions of 1 m$^3$ of perlite or vermiculite to 640 kg of gypsum if the required thickness of the plaster is not more than 25 mm; and

(b) in 2 coats if the required thickness is more than 25 mm, the first in the proportions of 1 m$^3$ of perlite or vermiculite to 800 kg of gypsum and the second in the proportions of 1 m$^3$ of perlite or vermiculite to 530 kg of gypsum.

S2C6  **Plaster of cement and sand or cement, lime and sand**

Plaster prescribed in Tables S1C2a to S1C2n—

(a) must consist of cement and sand or cement, lime and sand; and

(b) may be finished with gypsum, gypsum-sand, gypsum-perlite or gypsum-vermiculite plaster or with lime putty.
Governing requirements

S2C7  Plaster reinforcement

[2019: Sch. 5 (Annex): 1.6]

If plaster used as fire protection on walls is more than 19 mm thick—

(a) it must be reinforced with expanded metal lath that—
   (i) has a mass per unit area of not less than 1.84 kg/m²; and
   (ii) has not fewer than 98 meshes per metre; and
   (iii) is protected against corrosion by galvanising or other suitable method; or

(b) it must be reinforced with 13 mm x 13 mm x 0.7 mm galvanised steel wire mesh securely fixed at a distance from the face of the wall of not less than ⅓ of the total thickness of the plaster.

S2C8  Ashlar stone masonry

[2019: Sch. 5 (Annex): 2]

Ashlar masonry must not be used in a part of the building containing more than 2 storeys, and must not be of—

(a) aplite, granite, granodiorite, quartz dacite, quartz diorite, quartz porphyrite or quartz porphyry; or
(b) conglomerate, quartzite or sandstone; or
(c) chert or flint; or
(d) limestone or marble.

S2C9  Dimensions of masonry

[2019: Sch. 5 (Annex): 3]

The thicknesses of masonry of calcium-silicate, concrete and fired clay are calculated as set out in S2C10 to S2C12.

S2C10  Solid units

[2019: Sch. 5 (Annex): 3.1]

For masonry in which the amount of perforation or coring of the units does not exceed 25% by volume (based on the overall rectangular shape of the unit) the thickness of the wall must be calculated from the manufacturing dimensions of the units and the specified thickness of the joints between them as appropriate.

S2C11  Hollow units

[2019: Sch. 5 (Annex): 3.2]

For masonry in which the amount of perforation or coring of the units exceeds 25% by volume (based on the overall rectangular shape of the unit) the thickness of the wall must be calculated from the equivalent thicknesses of the units and the specified thickness of the joints between them as appropriate.

S2C12  Equivalent thickness

[2019: Sch. 5 (Annex): 3.3]

The equivalent thickness of a masonry unit is calculated by dividing the net volume by the area of one vertical face.
S2C13 Height-to-thickness ratio of certain walls

[2019: Sch. 5 (Annex): 5]

The ratio of height between lateral supports to overall thickness of a wall of ashlar, no-fines concrete, unreinforced concrete, solid gypsum blocks, gypsum-perlite or gypsum-vermiculite plaster on metal lath and channel, must not exceed—

(a) 20 for a loadbearing wall; or
(b) 27 for a non-loadbearing wall.

S2C14 Walls

[2019: Sch. 5 (Annex): 6.1]

If a wall of ashlar, solid gypsum blocks or concrete is plastered on both sides to an equal thickness, the thickness of the wall for the purposes of Tables S1C2a to S1C2n (but not for the purposes of S2C5) may be increased by the thickness of the plaster on one side.

S2C15 Columns

[2019: Sch. 5 (Annex): 6.2]

(1) Where Tables S1C2a to S1C2n indicate that column-protection is to be plastered, the tabulated thicknesses are those of the principal material.

(2) The thicknesses referred to in (1) do not include the thickness of plaster, which must be additional to the listed thickness of the material to which it is applied.

S2C16 Walls

[2019: Sch. 5 (Annex): 7.1]

In walls fabricated of gypsum-perlite or gypsum-vermiculite plaster on metal lath and channel—

(a) the lath must be securely wired to each side of 19 mm x 0.44 kg/m steel channels (used as studs) spaced at not more than 400 mm centres; and

(b) the gypsum-perlite or gypsum-vermiculite plaster must be applied symmetrically to each exposed side of the lath.

S2C17 Columns

[2019: Sch. 5 (Annex): 7.2]

(1) For the fire protection of steel columns with gypsum-perlite or gypsum-vermiculite on metal lath—

(a) the lath must be fixed at not more than 600 mm centres vertically to steel furring channels, and—

(i) if the plaster is to be 35 mm thick or more — at least 12 mm clear of the column; or
(ii) if the plaster is to be less than 35 mm thick — at least 6 mm clear of the column; or

(b) the plaster may be applied to self-furring lath with furring dimples to hold it not less than 10 mm clear of the column.

(2) For the purposes of (1), the thickness of the plaster must be measured from the back of the lath.

S2C18 Beams

[2019: Sch. 5 (Annex): 7.3]

For the fire protection of steel beams with gypsum-perlite or gypsum-vermiculite on metal lath—
(a) the lath must be fixed at not more than 600 mm centres to steel furring channels and at least 20 mm clear of the steel; and 
(b) the thickness of the plaster must be measured from the back of the lath.

S2C19  Columns

[2019: Sch. 5 (Annex): 8.1]

A column incorporated in or in contact on one or more sides with a wall of solid masonry or concrete at least 100 mm thick may be considered to be exposed to fire on no more than 3 sides.

S2C20  Beams

[2019: Sch. 5 (Annex): 8.2]

A beam, open-web joist, girder or truss in direct and continuous contact with a concrete slab or a hollow block floor or roof may be considered to be exposed to fire on no more than 3 sides.

S2C21  Filling of column spaces

[2019: Sch. 5 (Annex): 9]

1. The spaces between the fire-protective material and the steel (and any re-entrant parts of the column itself) must be filled solid with a fire-protective material like concrete, gypsum or grout.
2. The insides of hollow sections, including pipes, need not be filled.

S2C22  Hollow terracotta blocks

[2019: Sch. 5 (Annex): 10]

The proportion of cored holes or perforations in a hollow terracotta block (based on the overall rectangular volume of the unit) must not exceed the following:
(a) For blocks up to 75 mm thick — 35%.
(b) For blocks more than 75 mm but not more than 100 mm thick — 40%.
(c) For blocks more than 100 mm — 50%.

S2C23  Masonry

[2019: Sch. 5 (Annex): 11.1]

Masonry of calcium-silicate, fired clay and concrete for the protection of steel columns must have steel-wire or mesh reinforcement in every second course and lapped at the corners.

S2C24  Gypsum blocks and hollow terracotta blocks

[2019: Sch. 5 (Annex): 11.2]

Gypsum blocks and hollow terracotta blocks for the protection of steel columns must have steel-wire or mesh reinforcement in every course and lapped at corners.

S2C25  Structural concrete and poured gypsum

[2019: Sch. 5 (Annex): 11.3]

If a steel column or a steel beam is to be protected with structural concrete or poured gypsum, the concrete or gypsum must be reinforced with steel-wire mesh or steel-wire binding placed about 20 mm from its outer surface, and—
(a) for concrete or gypsum less than 50 mm thick, the steel wire must be—
   (i) at least 3.15 mm in diameter; and
   (ii) spaced at not more than 100 mm vertically; or
(b) for concrete or gypsum not less than 50 mm thick, the steel wire must be either—
   (i) of a diameter and spacing in accordance with (a); or
   (ii) at least 5 mm in diameter and spaced at not more than 150 mm vertically.

S2C26 Gypsum-perlite or gypsum-vermiculite plaster sprayed to contour

(1) If a steel column or steel beam is protected with either gypsum-perlite or gypsum-vermiculite plaster sprayed to contour and the construction falls within the limits of Tables S2C26a and S2C26b, the plaster must be reinforced with—
   (a) expanded metal lath complying with S2C7; or
   (b) galvanised steel wire mesh complying with S2C7.

(2) The reinforcement must be placed at a distance from the face of the plaster of at least 1/3 of the thickness of the plaster and must be securely fixed to the column or beam at intervals of not more than the relevant listing in Tables S2C26a and S2C26b.

(3) For the purposes of Tables S2C26a and S2C26b—
   (a) “vertical” includes a surface at not more than 10º to the vertical; and
   (b) “horizontal” includes a surface at not more than 10º to the horizontal; and
   (c) “underside” means the underside of any horizontal or non-vertical surface.

S2C27 Measurement of thickness of column and beam protection

[2019: Sch. 5 (Annex): 12.1]

The thickness of the fire protection to steel columns and steel beams (other than fire protection of gypsum-perlite or gypsum-vermiculite plaster sprayed on metal lath or sprayed to contour) is to be measured from the face or edge of the
steel, from the face of a splice plate or from the outer part of a rivet or bolt, whichever is the closest to the outside of the fire-protective construction, except that—

(a) if the thickness of the fire protection is 40 mm or more, rivet heads may be disregarded; and

(b) if the thickness of the fire protection is 50 mm or more—

(i) any part of a bolt (other than a high-tensile bolt) may be disregarded; and

(ii) a column splice plate within 900 mm of the floor may encroach upon the fire protection by up to a \( \frac{1}{4} \) of the thickness of the fire protection; and

(c) the flange of a column or beam may encroach by up to 12 mm upon the thickness of the fire protection at right angles to the web if—

(i) the column or beam is intended to have an FRL of 240/240/240 or 240/–/–; and

(ii) the flange projects 65 mm or more from the web; and

(iii) the thickness of the edge of the flange (inclusive of any splice plate) is not more than 40 mm.
S3C1 Scope

This Specification sets out the procedures for determining the fire hazard properties of assemblies tested to AS/NZS 1530.3.

S3C2 General requirement

The fire hazard properties of assemblies and their ability to screen their core materials as required under Specification 7 must be determined by testing in accordance with S3C3 to S3C6.

S3C3 Form of test

Tests must be carried out in accordance with—

(a) for the determination of the Spread-of-Flame Index and Smoke-Developed Index — AS/NZS 1530.3; and
(b) for the determination of the ability to prevent ignition and to screen its core material from free air — AS 1530.4.

S3C4 Test specimens

Test specimens must incorporate—

(a) all types of joints; and
(b) all types of perforations, recesses or the like for pipes, light switches or other fittings, which are proposed to be used for the member or assembly of members in the building.

S3C5 Concession

S3C4 does not apply to joints, perforations, recesses or the like that are larger than those in the proposed application and have already been tested in the particular form of construction concerned and found to comply with the conditions of the test.

S3C6 Smaller specimen permitted

A testing laboratory may carry out the test specified in S3C3(b) at pilot scale if a specimen (which must be not less than 900 mm x 900 mm) will adequately represent the proposed construction in the building, but the results of that test do not apply to construction larger than limits defined by the laboratory conducting the pilot examination.

Specification 42  Heating and cooling loads

S42C1  Scope
S42C2  Heating and cooling loads
Introduction to this Part

This Part focusses on minimising risk of structural failure in buildings; structural requirements for buildings in flood hazard areas; and, minimising risk of injuries caused by people colliding with glass panels, windows and doors.

Objectives

H1O1 Objective

The Objective is to—

(a) safeguard people from injury caused by structural failure; and
(b) safeguard people from loss of amenity caused by structural behaviour; and
(c) protect other property from physical damage caused by structural failure; and
(d) safeguard people from injury that may be caused by failure of, or impact with, glazing.

Functional Statements

H1F1 Functional Statements

(1) A building or structure is to withstand the combination of loads and other actions to which it may be reasonably subjected.

(2) Glazing is to be installed in a building to avoid undue risk of injury to people.

Performance Requirements

H1P1 Structural stability and resistance

(1) A building or structure, during construction and use, with appropriate degrees of reliability as specified in Table H1P1, must—

(a) perform adequately under all reasonably expected design actions; and
(b) withstand extreme or frequently repeated design actions; and
(c) be designed to sustain local damage, with the structural system as a remaining stable and not being damaged to an extent disproportionate to the original local damage; and
(d) avoid causing damage to other properties, by resisting the actions to which it may reasonably be expected to be subjected.

(2) The actions to be considered to satisfy (1) include but are not limited to—

(a) permanent actions (dead loads); and
(b) imposed actions (live loads arising from occupancy and use); and
(c) wind action; and
(d) earthquake action; and
(e) snow action; and
(f) liquid pressure action; and
(g) ground water action; and
(h) rainwater action (including ponding action); and
(i) earth pressure action; and
(j) differential movement; and
(k) time dependent effects (including creep and shrinkage); and
(l) thermal effects; and
(m) ground movement caused by—
   (i) swelling, shrinkage or freezing of the subsoil; and
   (ii) landslip or subsidence; and
   (iii) siteworks associated with the building or structure; and
(n) construction activity actions; and
(o) termite actions.

(3) The structural resistance of materials and forms of construction must be determined using five percentile characteristic material properties with appropriate allowance for—
   (a) known construction activities; and
   (b) type of material; and
   (c) characteristics of the site; and
   (d) the degree of accuracy inherent in the methods used to assess the structural behaviour; and
   (e) action effects arising from the differential settlement of foundations, and from restrained dimensional changes due to temperature, moisture, shrinkage, creep and similar effects.

(4) Glass installations that are at risk of being subjected to human impact must have glazing that—
   (a) if broken on impact, will break in a way that has a lower than 0.13% chance of penetrating adult skin is not likely to cause injury to people; and
   (b) resists a reasonably foreseeable human impact without breaking; and
   (c) is visually distinct with:
      (i) markings within the visual range of the occupants which achieve a 30% luminance contrast to both the floor and visual background, and of sizes no less than—
         (A) in parts of a building required to be accessible, 75,000 mm² of glass marked per metre of width, for the full width of the installation; or
         (B) in parts of a building not required to be accessible, 20,000 mm² of glass marked per metre of width; or
      (ii) other measures which achieve an equivalent level of visual impact.

*Table H1P1: Maximum acceptable annual probability of structural failure of buildings members and connection (1 in ...)*
Table Notes:

(A) The values in Table H1P1 are reliability-based, accounting for uncertainties in design parameters, but excluding accidents and gross human errors.

(B) The values are maximum acceptable notional probabilities of failure, not target values.

(C) Larger numbers in Table H1P1 represent more conservative (safer) designs than smaller numbers.

(D) If the structural failure of buildings, structures, members or connections is sudden, without providing timely clear warning of impending catastrophic collapse and without sufficient time to evacuate, failure should be treated as brittle.

(E) Serviceability considerations may dictate stringency greater than the requirements of Table H1P1.

Explanatory Information:

Because materials, structural behaviour and design actions are variable, practical designs must aim for target values of reliability, which must be more conservative (safer) than these values.

For example, an Importance Level 4 building with a maximum acceptable probability of failure of 1 in 400,000 is more conservative (safer) than an Importance Level 2 building with a maximum acceptable probability of failure of 1 in 7,000.

### Buildings in flood areas

#### H1P2

(1) A building in a flood hazard area must be designed and constructed, to the degree necessary, to resist flotation, collapse or significant permanent movement resulting from the action of hydrostatic, hydrodynamic, erosion and scour, wind and other actions during the defined flood event.

(2) The actions and requirements to be considered to satisfy (1) include but are not limited to—

(a) flood actions; and

(b) elevation requirements; and

(c) foundation and footing requirements; and

(d) requirements for enclosures below the flood hazard level; and
(e) requirements for structural connections; and
(f) material requirements; and
(g) requirements for utilities; and
(h) requirements for occupant egress.

Limitations:
H1P2 only applies to a Class 1 building.

QLD H1P3

Verification Methods

H1V1  Structural reliability

[2019: V2.1.1]

(1) This Verification Method is only applicable to components with a resistance coefficient of variation of at least 10% and not more than 40%.

(2) For components with a calculated resistance coefficient of variation value less than 10%, then a minimum value of 10% should be used.

(3) Compliance with H1P1(1), (2) and (3) is verified for the design of a structural component for strength when—

(a) the capacity reduction factor \( \Phi \) satisfies \( \Phi \leq \text{Average}(\Phi_G, \Phi_Q, \Phi_W) \), where \( \Phi_G, \Phi_Q, \Phi_W \) are capacity reduction factors for all relevant actions and must contain at least permanent (G), imposed (Q) and wind (W) actions; and

(b) the capacity reduction factors \( \Phi_G, \Phi_Q, \Phi_W \) are calculated for target reliability indices for permanent action \( \beta^{TG} \), for imposed action \( \beta^{TQ} \), for wind action \( \beta^{TW} \ldots \) in accordance with the equation:

\[
\beta = \ln \left( \frac{R}{S} \right) \frac{CS}{CR} \sqrt{\ln(CR.CS)},
\]

where—

\[
\left( \frac{R}{S} \right) = \left( \frac{\bar{R}}{\bar{SN}} \right) \left( \frac{\bar{S}}{\bar{RN}} \right);
\]

and

\( CR = 1 + V_R^2 \)

\( CS = 1 + V_S^2 \), where—

\( \bar{R} \)

\( \bar{S} \)

\( \bar{RN} \)

\( \bar{SN} \)

\( A \)

\( B \)

\( C \)

\( D \)

\( E \)

\( F \)

\( G \)

\( H \)

(\( A \) = ratio of mean resistance to nominal; and

(\( B \) = ratio of mean action to nominal; and

(\( C \) = correction factor for action; and

(\( D \) = correction factor for resistance; and

(\( E \) = coefficient of variation of the appropriate action as given in Table H1V1a; and

(\( F \) = coefficient of variation of the resistance; and

(\( G \) = appropriate load factor as given in AS/NZS 1170.0; and

(\( H \) = capacity factor for the appropriate action; and}
(c) the annual target reliability indices $\beta_{TG}, \beta_{TO}, \beta_{TW}, \ldots$ are established as follows:

(i) For situations where it is appropriate to compare with an equivalent Deemed-to-Satisfy product, a resistance model must be established for the equivalent Deemed-to-Satisfy product and $\beta_{TW}, \beta_{TG}, \beta_{TW}$ must be calculated for the equivalent Deemed-to-Satisfy product in accordance with the equation given at (b).

(ii) The target reliability indices $\beta_{TG}, \beta_{TO}, \beta_{TW}, \ldots$ thus established, must be not less than those given in Table H1V1b minus 0.5.

(iii) For situations where it is not appropriate to compare with an equivalent Deemed-to-Satisfy product, the target reliability index must be as given in Table H1V1b.

(4) The resistance model for the component must be established by taking into account variability due to material properties, fabrication and construction processes and structural modelling.

### Table H1V1a: Annual action models

<table>
<thead>
<tr>
<th>Design Action</th>
<th>Ratio of mean action to nominal</th>
<th>Coefficient of variation of the action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permanent Action ($\gamma G = 1.35$)</td>
<td>(\bar{G} / GN) = 1.00</td>
<td>VG = 0.10</td>
</tr>
<tr>
<td>Imposed Action ($\gamma Q = 1.50$)</td>
<td>(\bar{Q} / QN) = 0.50</td>
<td>VQ = 0.43</td>
</tr>
<tr>
<td>Wind Action ($\gamma W = 1.00$) (Non-cyclonic)</td>
<td>(\bar{W} / WN) = 0.33</td>
<td>VW = 0.49</td>

<tr>
<td>Wind Action ($\gamma W = 1.00$) (Cyclonic)</td>
<td>(\bar{W} / WN) = 0.16</td>
<td>VW = 0.71</td>
</tr>
<tr>
<td>Snow Action ($\gamma S = 1.00$)</td>
<td>(\bar{S} / SN) = 0.29</td>
<td>VS = 0.57</td>
</tr>
<tr>
<td>Earthquake Action ($\gamma E = 1.00$)</td>
<td>(\bar{E} / EN) = 0.05</td>
<td>VE = 1.98</td>
</tr>
</tbody>
</table>

### Table H1V1b: Annual target reliability indices ($\beta$)

<table>
<thead>
<tr>
<th>Type of action</th>
<th>Target reliability index $\beta$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permanent action</td>
<td>4.3</td>
</tr>
<tr>
<td>Imposed action</td>
<td>4.0</td>
</tr>
<tr>
<td>Wind, snow and earthquake action</td>
<td>3.7</td>
</tr>
</tbody>
</table>

**Table Notes:**

1. Table H1V1b is applicable for components that exhibit brittle failure similar to concrete as specified in AS 3600.
2. For components with creep characteristics similar to timber as specified in AS 1720.1, the target reliability index for permanent action shall be increased to 5.0.
3. The above target reliability indices are based on materials or systems that exhibit creep or brittle failure characteristics similar to timber and concrete.
4. Table H1V1b may also be applicable to materials or systems that exhibit creep or brittle failure differently to steel, timber or concrete provided that the creep and/or brittle nature of the material or system are properly accounted for in the design model.
5. The above target reliability indices are also applicable for materials or systems that exhibit ductile failure characteristics.

**H1V2 Structural robustness**

[2019: V2.1.2]

(1) Compliance with H1P1(1)(c) is verified for structural robustness if (2) and (3) are complied with.

(2) The structure is assessed such that the building remains stable and the resulting collapse does not extend further than the immediately adjacent storeys upon the notional removal in isolation of—
(a) any supporting column; or
(b) any beam supporting one or more columns; or
(c) any segment of a load bearing wall of length equal to the height of the wall.

(3) It is demonstrated that if a supporting structural component is relied upon to carry more than 25% of the total structure,
a systematic risk assessment of the building is undertaken and critical high risk components are identified and
designed to cope with the identified hazard or protective measures chosen to minimise the risk.

Explanatory Information:
H1V2 is a means to verify structural robustness of a building or structure in order to meet the requirements of H1P1(1)(c).
For further guidance, refer to the ABCB Handbook for Structural Robustness.

Deemed-to-Satisfy Provisions

H1D1 Deemed-to-Satisfy Provisions

[New for 2022]

(1) Where a Deemed-to-Satisfy Solution is proposed, Performance Requirements H1P1 and H1P2 are satisfied by
complying with H1D2 to H1D11.

(2) Where a Performance Solution is proposed, the relevant Performance Requirements must be determined in
accordance with A2G2(3) and A2G2(4) as applicable.

H1D2 Structural provisions

[2019: 3.0.1]

A Class 1 or Class 10 building must be constructed in accordance with—
(a) Section 2 of the Housing Provisions; or
(b) the relevant provisions of H1D3 to H1D11 relating to structural elements; or
(c) any combination thereof.

H1D3 Site preparation

[2019: 3.1.1, 3.1.2, 3.1.4]

(1) Performance Requirement H1P1 is satisfied for earthworks associated with the construction of a building or structure
if they are in accordance with Part 3.2 of the ABCB Housing Provisions, provided that the site is classified as A, S, M, H or E in accordance with 4.2.2 of the ABCB Housing Provisions Part 4.4 and the work is undertaken in normal
site conditions.

(2) Performance Requirement H1P1 is satisfied for an earth retaining structure associated with the construction of a
building or structure if it is designed and constructed in accordance with AS 4678.

QLD H1D3(3)

(3) Compliance with Part 3.4 of the ABCB Housing Provisions satisfies Performance Requirement H1P1 for termite risk
management.

Explanatory Information: “Normal” site conditions

“Normal” site conditions relates to parameters such as—
• the site conditions not being significantly modified by the removal of previous buildings or other structures; and
• the moisture conditions on site being as a result of seasonal and climatic changes; and
• the site conditions not being subject to unusual moisture conditions caused by drains, dams, channels, ponds or
tanks which are to be maintained or removed; and

- large trees have not been recently removed from the site in the area where the building is to be constructed; and
- other similar matters.

Further information regarding normal and abnormal site conditions can be found in AS 2870.

Explanatory Information: Earth retaining structures

AS 4678 contains requirements for earth retaining structures between 800 mm and 15 m in height, and does not apply to structures which are founded in exceptional site conditions (e.g. landslips), are subjected to sustained cyclic loading or are used for the purposes of water-retaining (e.g. dams and reservoirs).

It should be noted that H1D3(2) is only one way of achieving compliance with H1P1. Other ways of complying include the following:

(a) The relevant structural design manuals in H1D2.
(b) The relevant provisions of other Parts of the Housing Provisions relating to earth retaining structures.
(c) A Performance Solution that uses one of the other NCC Assessment Methods which verifies that compliance with H1P1 will be achieved.

Explanatory Information: Termite risk management

The intent of these requirements is to provide for a termite management system that deters termites from gaining entry to a building via a concealed route. The installation of a termite management system will not stop termite activity from occurring on the site.

H1D4 Footings and slabs

NSW H1D4(1)

(1) Performance Requirement H1P1 is satisfied for the design and construction of footings and slabs if they are installed in accordance with either (a) or (b):

(a) One of the following:
   (i) The footing or slab is constructed in accordance with AS 2870.
   (ii) Piled footings are designed in accordance with AS 2159 AS 3600.

(b) Subject to (2), Section 4 of the ABCB Housing Provisions.

(2) Section 4 of the ABCB Housing Provisions may only be used where—

(a) the footing is on a Class A, S, M, M-D, H or H-D or M site (classified in accordance with AS 2870) with a uniform bearing capacity; and

(b) the slab is not more than 30 m long, and any footing and slab—
   (i) is not more than 18 m long or wide; and
   (ii) does not contain permanent joints excluding construction joints in footing slabs; and
   (iii) is of a geometric shape containing only external right angles; and

(c) slabs containing permanent joints (e.g. construction joints) are not used, and any footing and slab in (b) has no more than one re-entrant corner; and

(d) the footing and slab are not constructed on soil classified as an aggressive soil type; and

(e) the structure supported by the footing does not contain—
   (i) more than two trafficable floors; or
   (ii) a wall height exceeding 8 m, excluding any gable; and

(f) the footing does not support more than one concrete slab; and

(g) the building does not include wing walls or masonry arches unless they are detailed for movement in accordance with Cement Concrete and Aggregates Australia TN 61; and
(h) single leaf earth or stone masonry walls do not exceed 3 m in height; and
(i) the site is considered to be normal as defined in Part 3.2 of the ABCB Housing Standard; and
(j) the site is not located in an alpine area; and
(k) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

Explanatory Information: Composite construction
Design requirements for other materials that may be used in combination with the above footing systems, including the use of heavy steel support beams, and piled footings, etc. are described in H1D2 and in Section 2 of the ABCB Housing Provisions.

Explanatory Information: Split level slabs
For the purposes of H1D4(2)(e) split level slabs are considered as one slab.

Figure H1D4\textsuperscript{a} (explanatory): Split level concrete slab

Explanatory Information: Geometric slab
For the purposes of H1D4(2)(b)(iii) and (c), a slab is considered geometric if it is square or rectangular and contains 4 external right angles as described in explanatory Figures H1D4b or H1D4c.
**Figure H1D4b (explanatory):** Geometric slab without re-entrant corner

**Figure H1D4c (explanatory):** Geometric slab with re-entrant corner
(1) **Performance Requirement** H1P1 is satisfied for unreinforced masonry, reinforced masonry, masonry veneer, masonry accessories and isolated masonry pier systems if they comply if it is designed and constructed in accordance with—

(a) AS 3700; or

(b) AS 4773.1 and AS 4773.2; or

(c) **Section 5** Part 5.2 of the ABCB Housing Provisions, provided—

(i) the building is located in an area with a design wind speed of not more than N3; and

(ii) masonry veneer walls—

(A) are constructed on footings that comply with Part 4.2; and

(B) comply with Parts 5.6 and 5.7; and

(iii) the building site soil classification is A, S or M; and

(iv) the framing that the masonry wall is tied to complies with H1D6; and

(v) the building is not constructed in an alpine area; and

(vi) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

(2) Where AS 3700 is applied to reinforced masonry or isolated masonry piers for the purposes of (1)(a), it must be applied so that—

(a) ‘(for piers—isolated or engaged)’ is removed from Clause 8.5.1(d); and

(b) where Clause 8.5.1 requires design as for unreinforced masonry in accordance with Section 7, the member must also be designed as unreinforced masonry in accordance with Tables 10.3 and 4.1(a)(i)(C) of AS 3700.

(3) Where Section 5 of the ABCB Housing Provisions is applied for the purposes of (1)(c), it is subject to the following limitations:

(a) For masonry veneer—

(i) the building is located in an area with a design wind speed of not more than N3; and

(ii) masonry veneer walls are constructed on footings that comply with H1D4; and

(iii) the building site soil classification is A, S or M; and

(iv) the framing that the masonry wall is tied to complies with H1D6 and H1D2 as appropriate; and

(v) the building is not constructed in an alpine area; and

(vi) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

(b) For isolated masonry piers—

(i) the building is located in an area with a design wind speed of not more than N3; and

(ii) isolated piers are constructed on footings that comply with H1D4; and

(iii) masonry units comply with Housing Provisions clause 5.2.3(3) and have a minimum compressive strength of—

(A) 6.2 MPa for solid or cored units; or

(B) 15 MPa for hollow units; and

(iv) the roof structure and any walls provide the required lateral bracing for the top of the isolated pier when determined in accordance with AS 3700, except—

(A) ‘(for piers—isolated or engaged)’ is removed from Clause 8.5.1(d); and

(B) where Clause 8.5.1 requires design as for unreinforced masonry in accordance with Section 7, the member must also be designed as unreinforced masonry in accordance with Tables 10.3 and 4.1(a)(i)(C) of AS 3700; and

(v) the building site soil classification is either A, S or M; and

(vi) the building is not constructed in an alpine area; and
(vii) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

(2) Performance Requirement H1P1 is satisfied for cavity brick unreinforced masonry if it is designed and constructed in accordance with one of the following:

(a) AS 3700.

(b) AS 4773.1 and AS 4773.2.

(c) Part 5.3 of the ABCB Housing Provisions provided—
   (i) the building is located in an area with a design wind speed of not more than N3; and
   (ii) cavity masonry walls—
      (A) are constructed on footings and/or slabs that comply with Part 4.2; and
      (B) comply with Parts 5.6 using components that comply with 5.7; and
   (iii) the building site soil classification is A, S or M in accordance with AS 2870; and
   (iv) the building is not constructed in an alpine area; and
   (v) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

(3) Performance Requirement H1P1 is satisfied for single leaf unreinforced masonry if it is designed and constructed in accordance with one of the following:

(a) AS 3700.

(b) AS 4773.1 and AS 4773.2.

(c) Part 5.4 of the ABCB Housing Provisions provided—
   (i) the building is located in an area with a design wind speed of not more than N3; and
   (ii) single leaf unreinforced masonry walls—
      (A) are constructed on footings and/or slabs that comply with Part 4.2; and
      (B) comply with Part 5.6 using components that comply with 5.7; and
   (iii) the building site soil classification is A, S or M in accordance with AS 2870; and
   (iv) the building is not constructed in an alpine area; and
   (v) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

(4) Performance Requirement H1P1 is satisfied for reinforced masonry if it is designed and constructed in accordance with one of the following:

(a) AS 3700, except—
   (i) ‘(for piers—isolated or engaged)’ is removed from clause 8.5.1(d); and
   (ii) where clause 8.5.1 requires design as for unreinforced masonry in accordance with Section 7, the member must also be designed and unreinforced masonry in accordance with Table 10.3 and 4.1(a)(i)(C) of AS 3700.

(b) AS 4773.2 and AS 4773.2.

(5) Performance Requirement H1P1 is satisfied for an isolated masonry pier system if it is designed and constructed in accordance with one of the following, as appropriate:

(a) AS 3700, except—
   (i) ‘(for piers—isolated or engaged)’ is removed from clause 8.5.1(d); and
   (ii) where clause 8.5.1 requires design as for unreinforced masonry in accordance with Section 7, the member must also be designed and unreinforced masonry in accordance with Table 10.3 and 4.1(a)(i)(C) of AS 3700.

(b) AS 4773.2 and AS 4773.2.

(c) Part 5.5 of the ABCB Housing Provisions provided—
   (i) the building is located in an area with a design wind speed of not more than N3; and
   (ii) isolated piers are constructed on footings that comply with Part 4.2; and
   (iii) masonry units comply with 5.2.3(4) and have a minimum compressive strength of—
(A) 6.2 MPa for solid or cored units; or
(B) 15 MPa for hollow units; and

(iv) the roof structure and any walls provide the required lateral bracing for the top of the isolated pier when determined in accordance with AS 3700, except—
(A) ‘(for piers—isolated or engaged)’ is removed from clause 8.5.1(d); and
(B) where clause 8.5.1 requires design as for unreinforced masonry in accordance with Section 7, the member must also be designed and unreinforced masonry in accordance with Table 10.3 and 4.1(a)(j)(C) of AS 3700; and

(v) the building site soil classification is A, S or M; and
(vi) the building is not constructed in an alpine area; and
(vii) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

(6) Performance Requirement H1P1 is satisfied for masonry accessories if they are constructed and installed in accordance with one of the following:
(a) AS 3700.
(b) AS 4773.1 and AS 4773.2.
(c) Part 5.6 of the ABCB Housing Provisions provided—
   (i) the building is located in an area with a design wind speed of not more than N3; and
   (ii) the building is not constructed in an alpine area; and
   (iii) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements.

Explanatory Information: Composite construction Design requirements for other materials that may be used in combination with masonry i.e. heavy steel support beams etc. are described in H1D2 and Section 2 of the ABCB Housing Provisions.

Explanatory Information: AS 1170.4
There are certain limitations on the application to domestic building structures such as Class 1a and Class 1b buildings in Appendix A of AS 1170.4. These limitations include height, roof slope, etc. For additional information refer to Appendix A of AS 1170.4.

H1D6 Framing [2019: 3.4.0, 3.4.2-3.4.4]

(1) Diagrams depicting framing members and associated terminology used to describe them are set out in Figures H1D6a, H1D6b and H1D6c, and in most cases are applicable for both steel and timber frame members.

(2) Terminology and spacing for structural steel members are set out in Tables H1D6a, H1D6b, H1D6f, and Figures H1D6d and H1D6e.

(3) Steel member abbreviations are as follows:
   (a) TFB = tapered flange beam.
   (b) UB = universal beam.
   (c) RHS = rectangular hollow section.
   (d) PFC = parallel flange channel.
   (e) TFC = tapered flange channel.
   (f) EA = equal angle
   (g) UA = unequal angle.
   (h) SHS = square hollow section.
(i) CHS = circular hollow section.

(43) Performance Requirement H1P1 is satisfied for steel framing if it is designed and constructed in accordance with one of the following:

(a) Residential and low-rise steel framing:

(b) Steel structures: AS 4100.

(c) Cold-formed steel structures: AS/NZS 4600.

QLD H1D6(54)

(54) Performance Requirement H1P1 is satisfied for a timber frame if it is designed and constructed in accordance with the following, as appropriate:

(a) Design of timber structures: AS 1720.1.

(b) Design of nailplated timber roof trusses: AS 1720.5.

(c) Residential timber-framed construction – non-cyclonic areas: AS 1684.2.

(d) Residential timber-framed construction – cyclonic areas: AS 1684.3.

(e) Residential timber-framed construction – non-cyclonic areas (simplified): AS 1684.4.

(f) Installation of particleboard flooring: AS 1860.2.

(65) Performance Requirement H1P1 is satisfied for structural steel sections if they are designed and constructed in accordance with one of the following:

(a) Steel structures: AS 4100.

(b) Cold-formed steel structures: AS/NZS 4600.

(c) For structural stability, strength and deflection, and subject to (76), Part 6.3 of the ABCB Housing Provisions.

(d) For corrosion protection, clause 6.3.4 of Part 6.3 of the ABCB Housing Provisions.

(76) For the purposes of (65)(c), Part 6.3 of the ABCB Housing Provisions may only be used where—

(a) the building is located in an area with a design wind speed of not more than N3; and

(b) the first dimension of steel sections is installed vertically; and

(c) all loads are uniformly evenly distributed (unless otherwise noted or allowed for); and

(d) the building is one for which Appendix A of AS 1170.4 contains no specific earthquake design requirements; and

(e) the structural steel member is not subject to snow loads; and

(f) the structural steel members are in buildings within geometric limits set out in AS 4055 clause 1.2.

(87) The use of structural software is subject to the following:

(a) Structural software used in computer aided design of a building or structure, that uses design criteria based on the Deemed-to-Satisfy Provisions of Section H, including its referenced documents, for the design of steel or timber trussed roof and floor systems and framed building systems, must comply with the ABCB Protocol for Structural Software.

(b) Structural software referred to in (a) can only be used for buildings within the following geometrical limits:

   (i) The distance from ground level to the underside of eaves must not exceed 6 m.
   (ii) The distance from ground level to the highest point of the roof, neglecting chimneys, must not exceed 8.5 m.
   (iii) The building width including roofed verandahs, excluding eaves, must not exceed 16 m.
   (iv) The building length must not exceed five times the building width.
   (v) The roof pitch must not exceed 35 degrees.

(c) The requirements of (a) do not apply to design software for individual frame members such as electronic tables similar to those provided in—

   (i) AS 1684; or

Table H1D6a: Effective member spacing for structural steel bearers and strutting beams—Single spanning rafter or joist

Figure H1D6d: Effective member spacing load width for structural steel bearers and strutting beams—Single spanning rafter or joist
Figure H1D6e: Effective member spacing for structural steel bearers and strutting beams—Continuous spanning rafter or joist
Explanatory Information:
For the purposes of H1D6(2) and (3), design requirements for other materials used in combination with steel or timber framing, including the use of concrete floors, structural steel support beams, etc. are described in the following locations.
within the ABCB Housing Provisions:

- Section 2 for structural provisions.
- **Part 6.3** for structural steel members.

The weight of roof or ceiling insulation, particularly if additional ceiling insulation is used for compliance with the energy efficiency provisions, needs to be considered in the selection of plasterboard, plasterboard fixings and building framing.

For the purposes of H1D6(4) and (5):

- Information on *design wind speeds* for particular areas may be available from the *appropriate authority*.
- A map indicating cyclonic regions of Australia is contained in **Part 2.2**.
- There are certain limitations on the application to domestic structures such as Class 1a and 1b buildings in Appendix A of AS 1170.4. These limitations include building height, roof slope, etc. For additional information refer to Appendix A of AS 1170.4.

H1D6(6) does not apply where a software package simply eliminates manual calculations and the process of the package requires identical methodology as that undertaken manually, e.g. AS 1684 span tables and bracing calculations.

The application of Part 6.3 of the ABCB Housing Provisions requires all loads to be distributed evenly unless they are noted otherwise or allowed for within the construction and placement of relevant building elements. *Part 6.3* of the ABCB Housing Provisions allows for point loads to be applied to strutting beams only if the loads are located within the middle third of the beam's span. In any other case, designs should be carried out in accordance with either H1D6(5)(a) or (b), or by a suitably qualified practitioner.

**Explanatory Information:** *Explanation of first dimension of steel section installed vertically*

H1D6(6) provides that *Part 6.3* of the ABCB Housing Provisions satisfies *Performance Requirement* H1P1 with respect to structural stability, strength and deflection if the “first dimension” of a steel section is installed vertically.

For example, 150 x 90 x 8UA used as a structural steel member (lintel) to support masonry over an opening. The “first dimension” designated is 150 mm (b₁) and is the vertical leg that resists bending loads over the width of the opening. This leg must be installed in the vertical plane.

The 90 mm (b₂) designation refers to the horizontal leg that rests under the masonry elements and transfers direct loads to the extremities of the opening while the 8 mm (t) designation refers to the thickness of the steel section.

A 150 x 90 x 8UA is designated as follows:

- **150** = leg length (b₁)
- **90** = leg length (b₂)
- **8** = thickness (t)

These designations are depicted in Explanatory Figure H1D6.

**Figure H1D6 (explanatory):**  Designation of first dimension of steel section installed vertically
H1D7  Roof and wall cladding

[2019: 3.5, 3.5.1-3.5.5]

(1) Diagrams depicting relevant roofing and supporting members and associated terminology used to describe them are set out in Figure H1D7a and Figure H1D7b.

(2) **Performance Requirement** H1P1 is satisfied for sheet roofing if it complies with one or a combination of the following:
   (a) Metal roofing:
      (i) AS 1562.1; and
      (ii) in wind regions C and D in accordance with Figure 2.2.3 in Section 2 of the ABCB Housing Provisions (cyclonic areas), metal roof assemblies, their connections and immediate supporting members must be capable of remaining in position notwithstanding any permanent distortion, fracture or damage that might occur in the sheet or fastenings under the pressure sequences A to G defined in Table H1D7.
   (b) Plastic sheet roofing: AS/NZS 1562.3.
   (c) Metal sheet roofing: Part 7.2 of the ABCB Housing Provisions, provided the building is located in an area with a design wind speed of not more than N3.

(3) **Performance Requirement** H1P1 is satisfied for roof cladding if it complies with one or a combination of the following:
   (a) Roof tiling: AS 2050.
   (b) Terracotta, fibre-cement and timber slates and shingles: AS 4597.
   (c) For roof tiles, Part 7.3 of the ABCB Housing Provisions, provided—
      (i) the building is located in an area with a design wind speed of not more than N3; and
      (ii) the roof tiles comply with AS 2049; and
      (iii) the roof has a pitch of not less than 15 degrees and not more than 35 degrees; and
      (iv) the roof tiles are installed in accordance with the provisions of Part 7.3

**VIC H1D7(4)**

(4) **Performance Requirement** H1P1 is satisfied for gutters and downpipes if they are designed and constructed in accordance with one of the following:
   (a) AS/NZS 3500.3.
   (b) Subject to (5), Part 7.4 of the ABCB Housing Provisions.

**VIC H1D7(5)**

(5) Part 7.4 of the ABCB Housing Provisions—
   (a) may only be used provided the roof drainage systems is connected to a stormwater drainage system that complies with H2D2; and
   (b) does not apply to— the removal of surface water from a storm having an average recurrence interval of 100 years for a Class 10 building where in the particular case there is no necessity for compliance.
      (i) the removal of surface water from a storm having an annual exceedance probability of 1% for a Class 10 building where in the particular case there is no necessity for compliance; or
      (ii) box gutters.

(6) **Performance Requirement** H1P1 is satisfied for timber and composite wall cladding if it is designed and constructed in accordance with—
   (a) for autoclaved aerated concrete wall cladding, AS 5146.1; or
   (b) for wall cladding, Part 7.5 of the ABCB Housing Provisions.

(7) **Performance Requirement** H1P1 is satisfied for a metal wall cladding if it is designed and constructed in accordance with AS 1562.1.

Table Notes:

1. Pt is the ultimate limit state wind pressure on internal and external surfaces as determined in accordance with AS/NZS 1170.2, modified by an appropriate factor for variability, as determined in accordance with Table B1 of AS/NZS 1170.0.
2. The rate of load cycling must be less than 3 Hz.
3. The single load cycle (sequence D) must be held for a maximum of 10 seconds.

Explanatory Information:

The requirements of H1D7(a)(ii) must be read in conjunction with the provisions of AS/NZS 1170.2. The ABCB commissioned research to establish a nationally consistent testing regime for metal roof cladding assemblies in cyclonic areas. The results of this research are contained in H1D7(a)(ii).

Low cycle fatigue cracking of metal roof cladding elements during tropical cyclones is a complex process where small changes in load, geometry or material properties can significantly affect the fatigue performance of the cladding system (includes immediate supports, fixings and cladding). The consequences of failure of an element can quickly lead to more elements progressively failing. These failed elements become wind driven debris and so pose a threat to people...
and other structures as potential missiles.

If a system does not successfully resist the fatigue loading sequence in Table H1D7, it does not comply. The test section consists of cladding elements, fastenings and immediate supporting members assembled together in a manner identical to those parts of the particular roof which the test section is intended to replicate.

H1D8 Glazing

(4) Performance Requirement H1P1 is satisfied for glazing and windows if designed and constructed in accordance with AS 2047 for the following glazed assemblies in an external wall:

(a) Windows excluding those listed in (2).
(b) Sliding and swinging glazed doors with a frame, including French and bi-fold doors with a frame.
(c) Adjustable louvres.
(d) Window walls with one-piece framing.

(2) Performance Requirement H1P1 is satisfied for glazing if designed and constructed in accordance with AS 1288 for all glazed assemblies not covered by (1) and the following glazed assemblies:

(a) All glazed assemblies not in an external wall.
(b) Revolving doors.
(c) Fixed louvres.
(d) Skylights, roof lights and windows in other than the vertical plane.
(e) Sliding and swinging doors without a frame.
(f) Windows constructed on site and architectural one-off window, which are not design tested in accordance with AS 2047.
(g) Second-hand windows, re-used windows and recycled windows.
(h) heritage windows.
(i) Glazing used in balustrades and sloping overhead glazing.

(3) Compliance with Section 8 of the ABCB Housing Provisions satisfies Performance Requirement H1P1 for glazing only, provided—

(a) the building is located in an area with a design wind speed of not more than N3; and
(b) glass is of a type recognised by AS 1288; and
(c) safety glazing is legibly marked in accordance with AS 1288; and
(d) glazing used in barriers complies with AS 1288; and
(e) safety glazing is made visible in accordance with Housing Provisions clause 8.3.7; and
(f) the glazing is not for the following assemblies in an external wall:
   (i) Windows excluding those listed in (g).
   (ii) Sliding and swinging doors with a frame, including French and bi-fold doors with a frame.
   (iii) Adjustable louvres.
   (iv) Window walls with one-piece framing; and
(g) the glazing is for all assemblies not covered by (f) and the following glazed assemblies:
   (i) All glazed assemblies not in an external wall.
   (ii) Revolving doors.
   (iii) Fixed louvres.
   (iv) Skylights, roof lights and windows in other than the vertical plane.
   (v) Sliding and swinging doors without a frame.
   (vi) Windows constructed on site and architectural one-off windows, which are not design tested in accordance
(vii) Second-hand windows, re-used windows and recycled windows.

(viii) Heritage windows.

(1) The requirements of (2) and (3) apply to the following:

(a) Windows, excluding—

(i) skylights, rooflights and windows not in the vertical plane; and

(ii) glass panels, glass blocks or glass bricks; and

(iii) fixed louvres or glazed sashes; and

(iv) windows constructed on site and architectural one-off windows that are not design tested in accordance with AS 2047; and

(v) second-hand, recycled or reused windows; and

(vi) heritage windows; and

(vii) windows in greenhouses or other horticultural buildings; and

(viii) other devices which transmit natural light directly from outside a building.

(b) Sliding or swinging glazed doors with a frame, including bi-fold and French doors with a frame.

(c) Adjustable louvres.

(d) Window walls with one piece framing.

(e) For (3), glazed assemblies not in external walls.

(2) Performance Requirement H1P1 is satisfied for glazed assemblies in an external wall if they are—

(a) designed and manufactured in accordance with AS 2047; or

(b) installed such that they—

(i) comply with Part 8.2 of the ABCB Housing Provisions; and

(ii) are in buildings with geometric limits set out in AS 4055 clause 1.2; and

(iii) are located in an area with a design wind speed of not more than N3.

(3) Performance Requirement H1P1 is satisfied for glazing in glazed assemblies if it is—

(a) designed and constructed in accordance with AS 1288; or

(b) complies with Part 8.3 of the ABCB Housing Provisions.

(4) Performance Requirement H1P1(4) for glazed assemblies at risk of human impact if they—

(a) are designed, constructed and installed in accordance with—

(i) for glass, AS 1288; and

(ii) for windows, AS 2047; or

(b) comply with Part 8.4 of the ABCB Housing Provisions.

Explanatory Information:

The reference to heritage windows in H1D8(2)(h) and (3)(g)(viii) is intended to apply to windows in heritage buildings.

The method of determining a heritage building is normally covered by the relevant State or Territory authority.

Information on design wind speed for particular areas (see H1D8(3)(a)) may be available from the appropriate authority.

For glazing in high wind areas refer to H1D2.

Explanatory Information: AS 2047

1. AS 2047 specifies requirements for the design, testing and manufacture of windows. The reference to windows in AS 2047 includes certain types of louvres and glazed doors that may be sliding, swinging, French or bi-fold doors.

2. AS 2047 does not cover assemblies that are internal or revolving doors, fixed louvres, skylights, rooflights and windows not installed in the vertical plane, windows in greenhouses or horticultural buildings, frameless sliding or swinging doors, windows constructed on site, one-off untested architectural designed windows, second-hand,
recycled or reused windows and heritage windows defined by relevant State and Territory authorities.

3. The assemblies referred to in Note 2, if installed in buildings, will be required to demonstrate compliance with relevant Performance Requirements. The Performance Solution used must be assessed using one or a combination of the Assessment Methods in A2G2.

Explanatory Information: AS 1288
In relation to building work covered by NCC Volume Two and the ABCB Housing Provisions, AS 1288 does not cover the selection and installation of glass for windows and doors in heritage buildings, restoration or repairs to leadlights, glass blocks, bricks or pavers.

Explanatory Information: AS 4055
Clause 1.2 of AS 4055 sets out geometric limitations that include the following:

(a) The distance from the ground level adjacent the building to the underside of eaves is not to exceed 6.0 m.
(b) The distance from the ground level of the building to the highest point of the roof, excluding chimneys is not to exceed 8.5 m.
(c) The width of the building, including verandas, but excluding eaves, is not to exceed 16.0 m.
(d) The length of the building is not to exceed five times its width.
(e) The roof pitch is not to exceed 35°.

H1D9 Earthquake areas

Performance Requirement H1P1 for Class 1 and 10 buildings constructed in areas subject to seismic activity is satisfied if the building is constructed in accordance with Section 2 of the ABCB Housing Provisions.

Explanatory Information:
1. Most domestic structures are not required to be specifically designed for earthquakes.
2. There are certain limitations on the application to domestic structures such as Class 1a and 1b buildings in Appendix A of AS 1170.4. These limitations include building height, roof slope, etc. For additional information refer to Appendix A of AS 1170.4.

QLD H1D10
VIC H1D10

H1D10 Flood hazard areas

Performance Requirement H1P2 for Class 1 buildings constructed in a flood hazard area is satisfied if the building is constructed in accordance with the ABCB Standard for Construction of Buildings in Flood Hazard Areas.

H1D11 Attachment of framed decks and balconies to external walls of buildings using a waling plate

Compliance with of the ABCB Housing Provisions satisfies Performance Requirement H1P1 for the attachment of a deck or balcony to an external wall provided—

(a) the deck or balcony is not located in an alpine area; and
(b) the height of the deck or balcony is not more than 3 m measured from the uppermost finished floor surface of...
the deck or balcony at any point to the top of any supporting footing; and
(c) the waling plate does not support—
   (i) more than one floor; or
   (ii) **loadbearing** or non-**loadbearing** walls; or
   (iii) roof loads; and
(d) the deck or balcony does not cantilever off the *external wall*; and
(e) the total imposed load on the deck or balcony does not exceed 2 kPa; and
(f) the deck or balcony framing including member sizes, spans and spacing, bracing for racking and shear forces, fixings and structural supports complies with H1D2; and
(g) the deck or balcony framing is constructed of—
   (i) **steel framing** in accordance with H1D6(2); or
   (ii) **timber framing** in accordance with H1D6(3); and
(h) **steel framing** in accordance with H1D6(2); and
(i) **timber framing** in accordance with H1D6(3); and
(j) the *external wall* supporting the deck or balcony is constructed of—
   (i) 190 mm thick fully core-filled concrete masonry, reinforced with vertical N12 bars at not more than 600 mm centres; or
   (ii) steel framing complying with H1D6(2); or
   (iii) timber framing complying with H1D6(3); and
(k) the *external wall* referred to in (i)(i) must be continuous from the upper most surface of the deck or balcony to the supporting footing and contain no openings or lintels below the deck or balcony; and
(l) the waling plate is fixed to the *external wall* in accordance with Housing Provisions clause 12.3.2 and attached by—
   (i) fixing the waling plate through wall cladding complying with H1D7(6) or H1D7(7), provided the cladding is directly fixed to the *external wall*; or
   (ii) removing parts of the wall cladding so that the waling plate is directly fixed to the *external wall*, with—
      (A) the junction of the waling plate and the *external wall* flashed in accordance with Housing Provisions clause 12.3.3; and
      (B) the cladding restored to its original strength by installing blocking supports as necessary on completion of installation; and
(m) the deck or balcony is braced to prevent *longitudinal* and *lateral* movement in accordance with Housing Provisions clause 12.3.4.

Explanatory Information:

A 2 kPa imposed load is commensurate with domestic and residential activities associated with Class 1 buildings (e.g. dwellings with limited occupancy and restricted public access) and is not appropriate for applications where the deck or balcony supports heavy equipment, spa/bathing pools or circumstances where the deck or balcony is intended for community access (e.g. applications with a mid-high occupancy and possibility of public access).

If the design live load of the deck or balcony is more than 2 kPa, the framing members of the deck or balcony must be designed by a **professional engineer** or other **appropriately qualified person** in accordance with the relevant structural design manuals in Part 2.2 of the ABCB Housing Provisions.

H1D11(ii) requires consideration to be given to restoring cladding, weatherproofing and structural properties. Other considerations include restoring the appropriate sound and thermal insulation, and the capacity to maintain an FRL where required.

H1D11 describes the circumstances under which the methods of attachment described in this Part are deemed appropriate.

Where a deck or balcony is constructed outside the conditions listed in H1D11, e.g. attachment to a masonry veneer wall, the method of attachment to the building or structure must be designed by a **professional engineer** or other **appropriately qualified person** in accordance with the relevant structural design manuals in Part 2.2 of the ABCB Housing
Provisions. Such a design will need to consider the suitability of the wall to withstand the loads imposed by the deck or balcony, and the capacity of the connections.

Examples of external wall construction that are outside the application of H1D11 include a masonry external wall that is not fully core-filled, cavity brick and masonry veneer construction where fasteners may be subject to withdrawal.

An alternative to attaching a deck or balcony directly to an external wall includes providing supporting piers, posts or columns or the like parallel to the wall line or at right angles to the wall.
Introduction to this Part

This Part focusses on reducing the risk of illness or injury as a result of the effects of moisture on a building, including surface water, weather and waste water discharge. It also includes requirements to prevent waste water discharge from damaging other property adjoining the site.

Objectives

H2O1 Objective

The Objective is to—

(a) safeguard occupants from illness or injury and protect the building from damage caused by—

(i) surface water; and

(ii) external moisture entering a building; and

(iii) the accumulation of internal moisture in a building; and

(iv) discharge of swimming pool waste water; and

(b) protect other property from damage caused by—

(i) redirected surface water; and

(ii) the discharge of swimming pool waste water.

Functional Statements

H2F1 Surface water

A building including any associated sitework is to be constructed in a way that protects people and other property from the adverse effects of redirected surface water.

H2F2 Weatherproofing and dampness

A building is to be constructed to provide resistance to moisture from the outside and moisture rising from the ground.

Limitations:

H2F2 does not apply to a Class 10 building except where its construction contributes to the weatherproofing of the Class 1 building.

H2F3 Drainage from swimming pools

Adequate means for the disposal of swimming pool water and drainage is to be provided to a swimming pool.
Performance Requirements

H2P1 Rainwater management

[2019: P.2.1]

1. **Surface water**, resulting from a storm having an annual exceedance probability of 5% average recurrence interval of 20 years and which is collected or concentrated by a building or sitework, must be disposed of in a way that avoids the likelihood of damage or nuisance to any other property.

2. **Surface water**, resulting from a storm having an annual exceedance probability of 1% average recurrence interval of 100 years must not enter the building.

3. A drainage system for the disposal of surface water resulting from a storm having an average recurrence interval of—

   (a) 20 years 5% must—

      (i) convey surface water to an appropriate outfall; and

      (ii) avoid surface water damaging the building; and

   (b) 100 years 1% must avoid the entry of surface water into a building.

Limitations:

H2P1(2) does not apply to a Class 10 building except where its construction contributes to the weatherproofing of the Class 1 building.

H2P2 Weatherproofing

[2019: P.2.2]

A roof and external wall (including openings around windows and doors) must prevent the penetration of water that could cause—

(a) unhealthy or dangerous conditions, or loss of amenity for occupants; and

(b) undue dampness or deterioration of building elements.

Limitations:

H2P2(a) does not apply to a Class 10 building except where its construction contributes to the weatherproofing of the Class 1 building.

NSW H2P3
SA H2P3

H2P3 Rising damp

[2019: P.2.3]

Moisture from the ground must be prevented from causing—

(a) unhealthy or dangerous conditions, or loss of amenity for occupants; and

(b) undue dampness or deterioration of building elements.

Limitations:

H2P3 does not apply to a Class 10 building where in the particular case there is no necessity for compliance.
H2P4 Drainage from swimming pools

[2019: P2.2.4]

A swimming pool must have adequate means of draining the pool in a manner which will not—

(a) cause illness to people; or
(b) affect other property.

Notes:
The NCC Volume Two and the ABCB Housing Provisions do not contain any Deemed-to-Satisfy Provisions for this Performance Requirement.

Verification Methods

H2V1 Weatherproofing

[2019: V2.2.1]

(1) Compliance with H2P2 for weatherproofing of an external wall is verified when—

(a) a prototype passes the procedure described in (2); and
(b) the external wall—
   (i) has a risk score of 20 or less, when the sum of all risk factor scores are determined in accordance with Table H2V1a; and
   (ii) is not subjected to an ultimate limit state wind pressure of more than 2.5 kPa; and
   (iii) includes only windows that comply with AS 2047.

(2) The test procedure referred to in (1)(a) must be as follows:

(a) The test specimen is in accordance with the requirements of (3).
(b) The test procedure is in accordance with the requirements of (4) and (5) as appropriate.
(c) The test specimen does not fail the criteria in (6).
(d) The test is recorded in accordance with the requirements of (7).

(3) Test specimen: The test specimen must incorporate—

(a) representative samples of openings and joints, including—
   (i) vertical and horizontal control joints; and
   (ii) wall junctions; and
   (iii) windows or doors; and
   (iv) electrical boxes; and
   (v) balcony drainage and parapet flashings; and
   (vi) footer and header termination systems; and
(b) for a cavity wall—
   (i) a transparent material for a proportion of the internal wall lining (to provide an unobstructed view of the external wall cladding) with sufficient structural capability and similar air tightness to resist the applied wind pressures; and
   (ii) a 15 mm diameter hole in the internal wall lining below a window.

(4) Test procedure for a direct fix cladding wall or unique wall:

(a) Apply 100% positive and negative serviceability wind pressures to the external face of the test specimen for a period of not less than 1 minute each.
Apply static pressure of either 300 Pa or 30% serviceability wind pressure, whichever is higher, in accordance with the water penetration test procedure at clause 8.5.2 of AS/NZS 4284.

(c) Apply cyclic pressure in accordance with—
   (i) the three stages of Table H2V1b; and
   (ii) the water penetration test procedure at clause 8.6.2 of AS/NZS 4284.

(5) Test procedure for a cavity wall:

(a) Apply 100% positive and negative serviceability wind pressures to the external face of the test specimen for a period of not less than 1 minute each.

(b) Apply static pressure of either 300 Pa or 30% serviceability wind pressure, whichever is higher, in accordance with the water penetration test procedure at clause 8.5.2 of AS/NZS 4284.

(c) Apply cyclic pressure in accordance with—
   (i) stage 3 of Table H2V1b; and
   (ii) the water penetration test procedure at clause 8.6.2 of AS/NZS 4284.

(d) To simulate the failure of the primary weather-defence or sealing, the following procedure must be applied to the test specimen:
   (i) Insert 6 mm diameter holes through the external face of the cavity wall in all places specified below:
      (A) Wall/window or wall/door junctions at ¾ height.
      (B) Immediately above the head flashing.
      (C) Through external sealing of the horizontal and vertical joints.
      (D) Above any other penetration detail not covered by (A) to (C).
   (ii) Within 30 minutes of the completion of (ii), remove the internal lining of the cavity wall and check for compliance with (6).
   (iii) Repeat the static and cyclic pressure tests of (b) and (c).
   (iv) With the internal lining removed, apply a final static pressure test at 50 Pa for a period of 15 minutes.

(6) Compliance:

(a) A direct fix cladding wall and unique wall are verified for compliance with H2P2 if there is no presence of water on the inside surface of the facade.

(b) A cavity wall is verified for compliance with H2P2 if there is no presence of water on the removed surface of the cavity, except that during the simulation of the failure of the primary weather-defence or sealing, water may—
   (i) transfer to the removed surface of the cavity due to the introduced defects (6 mm holes); and
   (ii) contact, but not pool on, battens and other cavity surfaces.

(7) Test report — The test report must include the following information:

(a) Name and address of the person supervising the test.

(b) Test report number.

(c) Date of the test.

(d) Cladding manufacturer’s name and address.

(e) Construction details of the test specimen, including a description, and drawings and details of the components, showing modifications, if any.

(f) Test sequence with the pressures used in all tests.

(g) For each of the static and cyclic pressure tests, full details of all leakages, including position, extent and timing.

Explanatory Information:
H2V1 contains the same test procedures, compliance criteria and reporting of test results that are contained in F1V1, in NCC Volume One. Consequently to the Guide to NCC Volume One contains detailed and supportive explanatory information that is also relevant to H2V1.

Deemed-to-Satisfy Provisions

H2D1  Deemed-to-Satisfy Provisions

[New for 2022]

(1) Where a Deemed-to-Satisfy Solution is proposed, Performance Requirements H2P1 to H2P3 are satisfied by complying with H2D2 to H2D8.

(2) Performance Requirement H2P4 must be complied with.

(3) Where a Performance Solution is proposed, the relevant Performance Requirements must be determined in accordance with A2G2(3) and A2G2(4) as applicable.

Notes:
There are no Deemed-to-Satisfy Provisions for H2P4.

H2D2  Drainage

[2019: 3.1.3.1]

Performance Requirement H2P1 is satisfied for drainage if it is designed and constructed in accordance with —

(a) AS/NZS 3500.3; or

(b) provided the stormwater drainage system otherwise complies with (a), Part 3.3 of the ABCB Housing Provisions for drainage of—

(i) roofs in areas subject to 5 minute duration rainfall intensities of not more than 255 mm per hour over an
annual exceedance probability of 5%, average recurrence interval of 20 years (as per Housing Provisions Table 7.4.3d to Table 7.4.3k, Table 7.3.2) where a drainage system is required; and

(ii) sub-soil areas where excessive soil moisture problems may occur; and

(iii) land adjoining and under buildings.

Explanatory Information:
1. The NCC does not require the installation of drainage systems. Accordingly these requirements need only be applied when these systems are used.
2. Information on the need for drainage systems may be obtained from the appropriate authority.
3. The legal discharge point from a building site is generally determined by local government authorities.

H2D3 Footings and slabs

Performance Requirement H2P3 is satisfied for footings and slabs if they are installed in accordance with H1D4(1)(a) or (b).

H2D4 Masonry

(1) H2D4(2)—
(a) applies to every external wall (including the junction between the wall and any window or door) of a Class 1 building; and
(b) does not apply to any Class 10 building except where its construction contributes to the weatherproofing of the Class 1 building.

(2) Performance Requirements H2P2 and H2P3 are satisfied for masonry veneer if it is designed and constructed in accordance with H1D5(1).

(3) Performance Requirements H2P2 and H2P3 are satisfied for cavity brick unreinforced masonry if it is designed and constructed in accordance with.

SA H2D4(24)

(24) Performance Requirements H2P2 and H2P3 are satisfied for weatherproofing of masonry and masonry veneer must be carried out in accordance with the appropriate provisions of one of the following:
(a) AS 3700.
(b) AS 4773.1 and AS 4773.2.
(c) Part 5.7 of the ABCB Housing Provisions provided masonry walls are constructed in accordance with H1D5 and the requirements of Part 5.7.

SA H2D4(35)
SA H2D4(4)

H2D5 Subfloor ventilation

Performance Requirement H2P3 is satisfied for subfloor ventilation if it is in accordance with Part 6.2 of the ABCB Housing Provisions.

Explanatory Information:
Part 6.2 applies to the subfloor space of all suspended floors of a building or deck, including but not limited to, timber and steel-framed subfloors and suspended concrete slabs.
H2D6  **Roof and wall cladding**  

Performance Requirements H2P1 and H2P2 are satisfied for damp and weatherproofing for roof and wall cladding if it is in accordance with H1D7(1), (2), (3), (5) or (6), as appropriate.

H2D7  **Glazing**  

Performance Requirement H2P2 is satisfied for weatherproofing for glazing if it is in accordance with H1D8(1) H1D8(2) only.

Explanatory Information:
When satisfying Performance Requirement H2P2, H1D8(1) H1D8(2) only references AS 2047 for windows. If AS 1288 is used for glazing in an external wall, it is still necessary to satisfy H2P2.

H2D8  **External waterproofing**  

Performance Requirement H2P2 is satisfied for the external waterproofing of a roofing system on flat roofs, roof terraces, balconies and terraces and other similar horizontal surfaces located above internal spaces of a building provided—

(a) membranes used in the external waterproofing system comply with AS 4654.1; and
(b) the design and installation of the external waterproofing system is in accordance with AS 4654.2.

Explanatory Information:
The design of occupiable roof-top spaces, decks, balconies, particularly where located over internal spaces of a building, can be susceptible to potential for water ingress into a building and causing damage. Therefore, careful consideration should be given to the design, construction and the materials used to minimise the potential for water ingress to spaces below. 

H2D8 prescribes external waterproofing requirements for buildings, and references AS 4654 Parts 1 and 2 that provide solutions for liquid and/or sheet membrane roofing systems on flat roofs, roof terraces, balconies and terraces located over habitable rooms. The term flat roof is commonly used to describe a near flat roof with enough pitch to provide drainage for rainwater.

AS 4654.1 sets out the requirements for materials forming part of a waterproofing system and AS 4654.2 sets out design and construction/installation requirements.

A Performance Solution in accordance with A2G2 would need to be provided for other types of external waterproofing materials and designs.
Introduction to this Part

This Part is intended to minimise the risk of illness, injury or loss of life occurring due to fire. Its requirements cover fire protection for fire separation in Class 1 and 10 buildings (including garage-top dwellings), smoke alarms and requirements for evacuation lighting in Class 1b buildings.

Objectives

H3O1  Objective

The Objective is to—
(a) safeguard the occupants from illness or injury by alerting them of a fire in the building so that they may safely evacuate; and
(b) avoid the spread of fire.

Functional Statements

H3F1  Protection from the spread of fire

A Class 1 building is to be protected from the spread of fire.

H3F2  Fire detection and early warning

A Class 1 building is to be provided with safeguards so that occupants are warned of a fire in the building so that they may safely evacuate.

Performance Requirements

H3P1  Spread of fire

SA H3P1(1)

(1) A Class 1 building must be protected from the spread of fire such that the probability of a building not being able to withstand the design heat flux of 92.6 kW/m² for a period of 60 minutes shall not exceed 0.01, when located within 900 mm from the allotment boundary or within 1.8 m from another building on the same allotment from—
(a) another building other than an associated Class 10 building; and
(b) the allotment boundary, other than a boundary adjoining a road or public space (see Figure H3P1).

(2) A Class 10a building must not significantly increase the risk of fire spread between Class 2 to 9 buildings.
Figure H3P1: Typical areas of potential fire spread

Figure Notes:
This diagram indicates areas of potential fire spread. This situation will differ for corner allotments, etc.

H3P2 Automatic warning for occupants

[2019: P2.3.2]

In a Class 1 building, occupants must be provided with automatic warning on the detection of smoke so that they may evacuate in the event of a fire to a place of safety with an efficacy greater than 0.95 and a reliability greater than 0.95, appropriate to the—

(a) function and use of the building; and
(b) occupant characteristics; and
(c) fire load and combustion characteristics; and
(d) potential fire intensity; and
(e) fire hazard.

Verification Methods

H3V1 Avoidance of spread of fire [H3P1(1)(a)]

[2019: V2.3.1.1]

Compliance with H3P1(1)(a) to avoid the spread of fire between buildings on the same allotment is verified when—

(a) the external walls and any openings in the external walls of a building, less than 1.8 m from another building, are capable of withstanding 92.6 kW/m² of heat flux for 60 minutes; and
(b) the external walls extend to the underside of a non-combustible roof covering or non-combustible eaves lining in accordance with clause 9.2.3 of the ABCB Housing Provisions.
H3V2  Avoidance of spread of fire [H3P1(1)(b)]

Compliance with H3P1(1)(b) to avoid the spread of fire from an allotment boundary is verified when—

(a) the external walls and any openings in the external walls of a building, less than 0.9 m from an allotment boundary, are capable of withstanding 92.6 kW/m² of heat flux for 60 minutes; and

(b) the external walls extend to the underside of a non-combustible roof covering or non-combustible eaves lining in accordance with clause 9.2.3 of the ABCB Housing Provisions.

H3V3  Avoidance of spread of fire [H3P1(2)] (adjoining allotment)

Compliance with H3P1(2) to avoid the spread of fire between buildings on adjoining allotments is verified when it is calculated that—

(a) a building will not cause heat flux in excess of those set out in column 2 of Table H3V3 at locations within the boundaries of an adjoining property set out in column 1 of Table H3V3 where another building may be constructed; and

(b) when located at the distances from the allotment boundary set out in column 1 of Table H3V3, a building is capable of withstanding the heat flux set out in column 2 of Table H3V3 without ignition.

Table H3V3:

<table>
<thead>
<tr>
<th>Column 1 (Location)</th>
<th>Column 2 (Heat flux [kW/m²])</th>
</tr>
</thead>
<tbody>
<tr>
<td>On boundary</td>
<td>80</td>

<tr>
<td>1 m from boundary</td>
<td>40</td>
</tr>
<tr>
<td>3 m from boundary</td>
<td>20</td>
</tr>
<tr>
<td>6 m from boundary</td>
<td>10</td>
</tr>
</tbody>
</table>

Explanatory Information:
H3V3 is equivalent to C1V1 in NCC Volume One. Guidance on the use of C1V1 can be found in the Guide to NCC Volume One, and is applicable to the use of H3V3.

H3V4  Avoidance of spread of fire [H3P1(2)] (same allotment)

Compliance with H3P1(2) to avoid the spread of fire between buildings on the same allotment is verified when it is calculated that a building—

(a) is capable of withstanding the heat flux set out in column 2 of Table H3V4 without ignition; and

(b) will not cause heat flux in excess of those set out in column 2 of Table H3V4, when the distance between the buildings is as set out in column 1 of Table H3V4.

Table H3V4:

</tr>
</tbody>
</table>

**Explanatory Information:**

H3V4 is equivalent to C1V2 in NCC Volume One. Guidance on the use of C1V2 can be found in the Guide to NCC Volume One, and is applicable to the use of H3V4.

---

**Deemed-to-Satisfy Provisions**

**H3D1**  
**Deemed-to-Satisfy Provisions**

[New for 2022]

(1) Where a *Deemed-to-Satisfy Solution* is proposed, *Performance Requirements* H3P1 and H2P2 are satisfied by complying with H3D2 and H3D3.

(2) Where a *Performance Solution* is proposed, the relevant *Performance Requirements* must be determined in accordance with A2G2(3) and A2G2(4) as applicable.

**H3D2**  
**Fire hazard properties, protection and separation**

[2019: 3.7.1-3.7.4]

(1) The following materials, though *combustible* or containing *combustible* fibres, may be used wherever a *non-combustible* material is required in the Provisions:

(a) Plasterboard.

(b) Perforated gypsum lath with a normal paper finish.

(c) Fibrous-plaster sheet.

(d) Fibre-reinforced cement sheeting.

(e) Pre-finished metal sheeting having a *combustible* surface finish not exceeding 1 mm thick and where the *Spread-of-Flame Index* of the product is not more than 0.

(f) *Sarking-type materials* that do not exceed 1 mm in thickness and have a *flammability Index* not greater than 5.

(g) Bonded laminated materials where—

(i) each lamina, including any core, is *non-combustible*; and

(ii) each adhesive layer does not exceed 1 mm in thickness and the total thickness of the adhesive layers does not exceed 2 mm; and

(iii) the *Spread-of-Flame Index* and the *Smoke-Developed Index* of the bonded laminated material as a whole do not exceed 0 and 3 respectively.

(2) The fire hazard properties of materials used in a Class 1 building, including floor or ceiling spaces common with a Class 10 building, must comply with the following:

(a) *Sarking-type materials* used in the roof must have a *flammability Index* not greater than 5.

(b) Flexible ductwork used for the transfer of products initiating from a heat source that contains a flame must comply with the fire hazard properties set out in AS 4254.1.

(3) Compliance with Part 9.2 of the ABCB Housing Provisions satisfies *Performance Requirement* H3P1 for fire separation.

(4) Compliance with Part 9.3 of the ABCB Housing Provisions satisfies *Performance Requirement* H3P1 for fire protection of separating walls and floors.

(5) Compliance with Part 9.4 of the ABCB Housing Provisions satisfies *Performance Requirement* H3P1 for fire separation of garage-top dwellings.
**H3D3**  
**Smoke alarms and evacuation lighting**

(1) Compliance with Part 9.5 of the ABCB Housing Provisions satisfies *Performance Requirement H3P2* for smoke alarms and evacuation lighting.

(2) For the purposes of (1), a Class 1 building includes a Class 10a private garage located above or below the Class 1 building.

**Explanatory Information: Smoke alarms general requirements**

*Performance Requirement H3P2* and the *Deemed-to-Satisfy Provisions* of Part 9.5 of the ABCB Housing Provisions require automatic warning on the detection of smoke in buildings, so that occupants may be alerted to a fire in order to evacuate to a place of safety.

**Explanatory Information: Different smoke alarm requirements for Class 1a and Class 1b buildings**

Part 9.5 of the ABCB Housing Provisions specifies different smoke alarm requirements for Class 1a and Class 1b buildings. The main difference is that a Class 1b building is *required* to have a greater number of smoke alarms, i.e. smoke alarms must be installed in all bedrooms, and a system of lighting must be installed to assist evacuation. This is due to Class 1b buildings generally being used for more transient purposes and the occupants being less familiar with the building layout.

**Explanatory Information: Smoke alarms complying with AS 3786**

Clause 9.5.1(b) of the ABCB Housing Provisions requires a smoke alarm(s) to comply with AS 3786. AS 3786 contains the requirements for the design and performance of electrically operated smoke alarms containing both detection and alarm facilities. Types of smoke alarms prescribed in AS 3786 include photoelectric, ionisation or a combination of the two.

**Explanatory Information: Smoke alarms to be connected to consumer mains source**

Clause 9.5.1(c) of the ABCB Housing Provisions requires that a smoke alarm be connected to the consumer mains electricity source where a consumer mains source is supplied to the building. A smoke alarm complying with AS 3786, that is intended for connection to an external power source, is *required* to be provided with a secondary power source i.e. a source of power to supply the smoke alarm in the event that the primary power source is unavailable. Generally, the requirement is met by providing mains powered smoke alarms with a battery back-up.

**Explanatory Information: Interconnection of smoke alarms**

Clause 9.5.1(d) of the ABCB Housing Provisions requires that alarms be interconnected to provide a common alarm so that if one alarm in the dwelling activates, the other alarms automatically activate, which will increase the likelihood of sleeping occupants becoming aware of the detection of smoke. Alarms of a Class 1 building need not be interconnected with alarms in another Class 1 building or a private garage which does not belong to the Class 1 building.

**Explanatory Information: Location of smoke alarms**

When deciding on the position of smoke alarms it is important to remember that they are intended to detect smoke before it reaches the sleeping occupants of a building.

The ensuing alarm is designed to wake the occupants and give them time to evacuate the building.

**Explanatory Information: Smoke alarms required on other storeys not containing bedrooms**

In addition to a smoke alarm being *required* to be provided on storeys containing bedrooms, a smoke alarm is also *required* on each other storey that is not already provided with a smoke alarm even if those storeys consist of only carparking, bathrooms, laundries and the like. “Storey” in this context differs from the definition contained in NCC Volume One which excludes such spaces from being considered as storeys.

Reference to “storey” only applies within a single dwelling. For example, if a storey contains a private garage belonging
to the Class 1a dwelling in addition to a *private garage* which does not belong to the Class 1a dwelling, smoke alarms must be installed in both *private garages*.

Where the other storey is a Class 10a *private garage*, clause 9.5.1(b) of the ABCB Housing Provisions permits the use of any other alarm deemed suitable in accordance with AS 1670.1 provided smoke alarms complying with AS 3786 are installed elsewhere in the Class 1 building.

---

### Explanatory Information: Nuisance alarms

Smoke alarms are extremely sensitive and may detect smoke and moisture created by common household activities such as burnt toast or steam from a bathroom.

Accordingly, to reduce the likelihood of nuisance alarms, it is preferable that smoke alarms are not located near cooking appliances and bathrooms. However, if it is necessary to locate alarms in these positions, the type of alarm installed may need to be considered as some alarm types may be more suitable in certain locations.

---

### Explanatory Information: Added flexibility when considering smoke alarm location

The options described in the ABCB *Housing Provisions* are not the only means available for complying with this Part. The performance-based nature of the NCC provides flexibility to develop alternative methods if it is preferred to meet the *Performance Requirement* in some other way. This added flexibility may be utilised when considering the location of smoke alarms.
# Introduction to this Part

This Part is intended to address several different factors which impact on health and amenity. These factors include: waterproofing of wet areas; room heights; kitchen, laundry and toilet facilities; lighting; ventilation; sound insulation; and condensation.

## Objectives

### H4O1 Wet areas

[2019: O2.4.1]

The Objective is to safeguard the occupants from illness or injury and protect the building from damage caused by the accumulation of internal moisture arising from the use of **wet areas** in a building.

### H4O2 Room heights

[2019: O2.4.2]

The Objective is to safeguard the occupants from injury or loss of amenity caused by inadequate height of a room or space.

### H4O3 Facilities

[2019: O2.4.3]

The Objective is to—

- safeguard occupants from illness caused by infection; and
- safeguard occupants from loss of amenity arising from the absence of adequate personal hygiene facilities; and
- enable occupants to carry out laundering; and
- provide for facilities to enable food preparation; and
- enable unconscious occupants of **sanitary compartments** to be removed from the compartment.

### H4O4 Light

[2019: O2.4.4]

The Objective is to safeguard occupants from injury, illness or loss of amenity due to—

- isolation from natural light; and
- lack of adequate artificial lighting.

### H4O5 Ventilation

[2019: O2.4.5]

The Objective is to safeguard occupants from illness or loss of amenity due to lack of air freshness.
H4O6  Sound insulation

The Objective is to safeguard occupants from illness or loss of amenity as a result of undue sound being transmitted between adjoining dwellings.

H4O7  Condensation and water vapour management

The Objective is to reduce the likelihood of condensation or water vapour build-up causing illness, injury or loss of amenity for building occupants.

Functional Statements

H4F1  Wet areas

A building is to be constructed to avoid the likelihood of—
   (a) the creation of any unhealthy or dangerous conditions; or
   (b) damage to building elements,
caused by dampness or water overflow from bathrooms, laundries and the like.

H4F2  Room heights

A building is to be constructed to provide height in a room or space suitable for the intended use.

H4F3  Facilities

A building is to be provided with suitable—
   (a) space and facilities for personal hygiene; and
   (b) space or facilities for laundering; and
   (c) space and facilities for the preparation and cooking of food; and
   (d) space or other means to permit an unconscious occupant to be removed from a sanitary compartment; and
   (e) means for the sanitary disposal of waste water.

Applications:
H4F3 only applies to a Class 1 building.

H4F4  Light

(1) A habitable room within a building is to be provided with openings to admit adequate natural light consistent with its function or use.
(2) A space within a building used by occupants is to be provided with artificial lighting consistent with its function or use which, when activated in the absence of suitable natural light, will enable safe movement.

<th>H4P3</th>
<th>Personal hygiene and other facilities</th>
</tr>
</thead>
</table>
| [2019: P2.4.3] | (1) Suitable sanitary facilities for personal hygiene must be provided in a convenient location within or associated with a building, appropriate to its function or use.  

(2) Laundering facilities or space for laundering facilities and the means for sanitary disposal of waste water must be provided in a convenient location within or associated with a building, appropriate to its function or use.  

(3) A food preparation facility must be provided which includes— |
(a) a means for food rinsing, utensil washing and the sanitary disposal of associated waste water; and
(b) a means for cooking food; and
(c) a space for food preparation.

(4) A **sanitary compartment** must be constructed with sufficient space or other means to enable an unconscious occupant to be removed from the compartment.

Applications:
H4P3 only applies to a Class 1 building.

Explanatory Information:
For the purposes of H4P3(2), waste water includes water soiled as a result of clothes washing, mopping floors and other domestic cleaning processes.

---

**H4P4 Lighting**

[2019: P2.4.4]

(1) A **habitable room** must be provided with windows, where appropriate to the function or use of that part of the building, so that natural light, when available, provides an **average daylight factor** of not less than 2%.

(2) Artificial lighting must be installed to provide an **illuminance** of not less than 20 lux appropriate to the function or use of the building to enable safe movement by occupants.

Applications:
H4P4(2) only applies—
(a) to sanitation compartments, bathrooms, shower rooms, airlocks, laundries and the like; and
(b) if natural light of a suitable standard is not available.

Explanatory Information:
H4P4(1) nominates a minimum **average daylight factor** for rooms provided with natural light. Note that H4V2 provides a method by which **average daylight factor** may be calculated.

To comply with H4P4(2), the level of artificial light must enable safe movement by occupants, appropriate to the use of the building. For example, in a movie room a lower level of lighting may be appropriate while a movie is being screened, however at the beginning and end of the movie when occupants are entering and exiting the movie room the minimum lighting level of 20 lux may be appropriate.

---

**H4P5 Ventilation**

[2019: P2.4.5]

(1) A space within a building used by occupants must be provided with means of ventilation with **outdoor air** which will maintain adequate air quality.

(2) A mechanical air-handling system installed in a building must control—
(a) the circulation of objectionable odours; and
(b) the accumulation of harmful contamination by micro-organisms, pathogens and toxins.

(3) Contaminated air must be disposed of in a manner which does not unduly create a nuisance or hazard to people in the building or **other property**.
H4P6  Sound insulation

(1) Walls separating dwellings must provide insulation against the transmission of airborne sound sufficient to prevent illness or loss of amenity to the occupants.

(2) Walls separating a bathroom, sanitary compartment, laundry or kitchen in a dwelling from a habitable room (other than a kitchen) in an adjoining dwelling, must provide insulation against impact generated sound sufficient to prevent illness or loss of amenity to the occupants.

(3) The required sound insulation of walls must not be compromised by the incorporation or penetration of a pipe or other service element.

H4P7  Condensation and water vapour management

Risks associated with water vapour and condensation must be managed to minimise their impact on the health of occupants.

Applications:
H4P7 only applies to a Class 1 building.

Verification Methods

H4V1  Room or space height

(1) Compliance with H4P2 is verified where the height of a room or space provides an appropriate activity support level that does not unduly interfere with its intended function.

(2) For a room or space in (1), the activity support level must consider the dimensions of—
   (a) doors, ramps, barriers, stairs and windows; and
   (b) fixed fittings and domestic services; and
   (c) fixed and moveable equipment or furniture; and
   (d) occupant circulation spaces.

Explanatory Information:
The intent of H4P2 is the height of a room or space is sufficient for the intended use of the room or space. ‘Intended use’ recognises that the height required in a room or space is directly related to the room or space’s intended function.

H4V1 is a means to verify that the height of a room or space is suitable for the intended use, and therefore meets the requirement of H4P2.

In relation to the intended function of a room or space, the activities that are likely to be undertaken by occupants in the room of space, as well the features of the activities, are relevant considerations when determining a suitable height.

For example, if the intended use of a room is a gymnasium, then gymnastic activities are likely to be undertaken in the room. These activities often involve jumps and flips which require significant space in order to be undertaken safely.

In terms of the occupants, their features and needs are also relevant when determining a suitable height. For example, occupant features and needs would differ between rooms or spaces intended as a child’s play area, and rooms or spaces intended for adult’s indoor cricket.

The method requires consideration of ‘activity traits’, ‘occupant traits’ and ‘activity support level’. Refer to Schedule 2 for more information on these terms.
When determining the *activity support level*, the method requires consideration of the relevant dimensions of items likely to be located in the room or space, as well as occupant circulation spaces.

Some of these considerations are—

- stairs and ramps, since the height of the room of the space will change relative to the occupant during incline and decline; and
- fixed fittings such as lights that may protrude from the ceiling and wash-basins; and
- domestic services such as air-conditioners, heaters, ceiling fans and heated water systems; and
- fixed equipment such as manufacturing or processing equipment, permanent signage or displays and lifts; and
- moveable equipment such as whitegoods; and
- fixed furniture such as built-in wardrobes and permanent seating; and
- moveable furniture such as wardrobes, desks and beds; and
- occupant circulation spaces so that occupants can move comfortably and safety around the room or space.

For example, the location and dimensions of a wash-basin is a relevant consideration in determining the *activity support level* of a bathroom. This is because an occupant will typically need to access the wash-basin whilst standing, which will influence the necessary height of the space.

Another example is the consideration of moveable equipment such as a refrigerator in a kitchen. If the intended use of a space is a kitchen, then it would be unrealistic to determine a sufficient height for the room without considering the height of a typical refrigerator that would be located in the room.

---

**H4V2 Verification of suitable natural light**

[2019: V2.4.4]

Compliance with H4P4(1) is verified for the provision of natural light in all *habitable rooms* when the average daylight factor for each *window* is determined in accordance with the following formula:

$$\text{Average Daylight Factor} = \frac{W}{A} \frac{T\theta}{(1 - R^2)}$$

where—

(a) \(W\) = the net area of the light transmitting area of the *window* (m\(^2\)); and
(b) \(A\) = the total area of the internal wall, floor and ceiling surfaces (m\(^2\)); and
(c) \(T\) = the diffuse light transmittance of the *window*; and
(d) \(\theta\) = visible sky angle in degrees, measured in a plane normal to and from the centre of the *window*; and
(e) \(R\) = the area-weighted average reflectance of area \(A\).

---

**Explanatory Information:**

H4V2 is equivalent to F4V3 in NCC Volume One. Guidance on the use of F4V3 can be found in the Guide to NCC Volume One, and is applicable to the use of H4V2.

---

**H4V3 Verification of indoor air quality**

[2019: V2.4.5]

For a Class 1 building, compliance with H4P5(1) and H4P5(2)(a) is verified when it is determined that the building under typical conditions in use is provided with sufficient ventilation with *outdoor air* such that contaminant levels do not exceed the limits specified in Table H4V3.

---

**Table H4V3: Maximum contaminant limits for acceptable indoor air quality**

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Averaging Time</th>
<th>Maximum Air Quality Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon dioxide, CO(_2)</td>
<td>8 hours</td>
<td>850 ppm Note 1</td>
</tr>
</tbody>
</table>

---

Note 1: For this pollutant, the concentration limit applies to the concentration measured in the room or space.
Table Notes:
1. Based on body odour metric (i.e. 450 ppm above ambient CO₂ level of 400 ppm and demand control ventilation provisions in AS 1668.2).
2. Based on pressure of 101.325 kPa and temperature of 25 degrees (i.e. the conversion is mg/m³ = ppm (molecular weight/24.4)).

### H4V4  
#### Sound insulation

Compliance with H4P6(1) and (3) to insulate against transmission of airborne sound through walls separating dwellings is verified when it is measured in-situ that the wall has a weighted standardised level difference with spectrum adaptation term \(D_{ntw} + C_{tr}\) not less than 45 when determined under AS/NZS ISO 717.1.

### H4V5  
#### Verification of condensation management

(1) Compliance with H4P7 is verified when modelling determines that moisture will not accumulate—
   
   (a) interior to the primary water control layer within a building envelope; or
   
   (b) on the interior surface of the water control layer.

(2) Modelling used for the purposes of (1) must assess the effects of—
   
   (a) indoor and outdoor temperature and humidity conditions; and
   
   (b) heating and cooling set points; and
   
   (c) rain absorption; and
   
   (d) wind pressure; and
   
   (e) solar radiation; and
   
   (f) material hygrothermal properties.
Deemed-to-Satisfy Provisions

H4D1 Deemed-to-Satisfy Provisions  
[New for 2022]

(1) Where a Deemed-to-Satisfy Solution is proposed, Performance Requirements H4P1 to H4P7 are satisfied by complying with H4D2 to H4D9.

(2) Where a Performance Solution is proposed, the relevant Performance Requirements must be determined in accordance with A2G2(3) and A2G2(4) as applicable.

H4D2 Wet areas and external waterproofing  
[2019: 3.8.11, 3.8.1.2]

Compliance with Part 10.2 of the ABCB Housing Provisions satisfies Performance Requirement H4P1 for wet areas provided the wet areas are protected in accordance with the appropriate requirements of 10.2.7 to 10.2.34 of the ABCB Housing Provisions and external waterproofing.

H4D3 Materials and installation of wet area components and systems  
[New for 2022]

Performance Requirement H4P1 is satisfied for materials and the installation of wet area components and systems if they comply with either—

(a) AS 3740; or
(b) 10.2.7 to 10.2.34 of the ABCB Housing Provisions.

Notes: Livable housing design

In a Class 1a dwelling, at least one bathroom and at least one toilet must comply with the ABCB Standard for Livable Housing Design, which may override the requirements on H4D3.

Explanatory Information:

AS 3740 and the ABCB Housing Provisions contain requirements for shower hobs and shower over bath configurations, however these may only be used in a bathroom that is not subject to the ABCB Standard for Livable Housing Design. Generally, the ABCB Standard for Livable Housing Design only applies to one bathroom per dwelling. Therefore, shower hobs and the like may only be used in additional bathrooms.

H4D4 Room heights  
[2019: 3.8.2]

Compliance with Part 10.3 of the ABCB Housing Provisions satisfies Performance Requirement H4P2 for room heights.

H4D5 Facilities  
[2019: 3.8.3]

Compliance with Part 10.4 of the ABCB Housing Provisions satisfies Performance Requirement H4P3 for facilities.

Explanatory Information: Additional requirements

Additional requirements relating to facilities for people with a disability in Class 1b and Class 10a buildings are contained in Volume One of the NCC. These requirements are based on the Disability (Access to Premises – Buildings) Standards (Premises Standards) which are available from the Australian Government Attorney-General’s Department website at...
Explanatory Information: Cross-volume considerations

NCC Volume Three contains a number of plumbing and drainage provisions which are relevant to facilities. These include, but may not be limited to, the following:

- Installation of sanitary plumbing and drainage systems: Parts C1 and C2.

H4D6 Light

Compliance with Part 10.5 of the ABCB Housing Provisions satisfies Performance Requirement H4P4 for lighting.

H4D7 Ventilation

[2019: 3.8.5]

(1) Except for an exhaust fan from a sanitary compartment, laundry, kitchen or bathroom, Performance Requirement H4P5 is satisfied for a mechanical ventilation system if it is installed in accordance with AS 1668.2.

(2) Compliance with Part 10.6 of the ABCB Housing Provisions satisfies Performance Requirement H4P5 for ventilation.

H4D8 Sound insulation

[2019: 3.8.6]

Compliance with Part 10.7 of the ABCB Housing Provisions satisfies Performance Requirement H4P6 for sound insulation.

H4D9 Condensation management

[2019: 3.8.7]

Compliance with Part 10.8 of the ABCB Housing Provisions satisfies Performance Requirement H4P7 for condensation management.

Explanatory Information:

The intent of these requirements is to assist in the mitigation of condensation within a building. The installation of a condensation management system may not prevent condensation from occurring.
Introduction to this Part

This Part is intended to reduce the likelihood of people being injured when accessing or moving about a building. It does this by setting requirements for the construction of stairways and ramps, slip resistance, and the design and construction of barriers to prevent falls.

Objectives

H5O1 Objective

The Objective is to provide people with safe access to and within a building.

Functional Statements

H5F1 Safety from falling

A building is to provide safe access for people to the services and facilities within.

Performance Requirements

H5P1 Movement to and within a building

So that people can move safely to and within a building—

(a) walking surfaces must have safe gradients; and
(b) any stairway or ramp must—
   (i) have suitable handrails where necessary to assist and provide stability to people using the stairway or ramp; and
   (ii) have suitable landings to avoid undue fatigue of users; and
   (iii) be suitable for safe passage in relation to the nature, volume and frequency of likely usage; and
   (iv) have slip-resistant walking surfaces on ramps, and on stairway treads or near the edge of the nosing.

H5P2 Fall prevention barriers

(1) A barrier must be provided where people could fall—
   (a) 1 m or more—
      (i) from a floor or roof or through an opening (other than through an openable window) in the external wall; or
      (ii) due to a sudden change of level within or associated with a building; or
   (b) 2 m or more from a floor through an openable window in a bedroom; or
(c) 4 m or more from a floor through an openable window not covered by (b).

(2) A barrier required by (1) must be—

(a) continuous and extend for the full extent of the hazard; and

(b) of a height to protect people from accidentally falling from the floor or roof or through the opening or openable window; and

(c) constructed to prevent people from falling through the barrier; and

(d) capable of restricting the passage of children; and

(e) of strength and rigidity to withstand—

(i) the foreseeable impact of people; and

(ii) where appropriate, the static pressure of people pressing against it.

Verification Methods

H5V1 Wire barriers

Compliance with H5P2(2)(c) and (d) for wire barriers is verified when the wire barrier passes the test described below:

(a) The test must be carried out on either—

(i) a prototype of a wire barrier that is identical to that proposed to be installed on site; or

(ii) a wire barrier installed on site.

(b) The test equipment must consist of the following:

(i) A horizontally suspended 125 mm diameter, 405 mm long cylinder of 1 mm thick steel having a highly polished 105 mm long cone at one end with a 20 mm diameter flat leading edge to which an eye bolt is fixed.

(ii) A sufficiently flexible horizontal cable with mechanisms capable of applying and measuring a tension of 150 N (or a 15.3 kg weight suspended over a low friction pulley) is to be attached to the eye bolt (see Figure H5V1).

(iii) A mechanism capable of measuring the tension force applied to each wire.

(c) The test procedure must be as follows:

(i) Tension the wires, within their safe load, to the same tension in all wires and measure the tensions with a strain indicator.

(ii) For—

(A) horizontal or near horizontal wires, position the cone against a pair of wires at the mid-span between supports, then apply the 150 N tension force to the cone; and

(B) vertical wires, position the cone against a pair of wires at the mid-span between supporting rails, then apply the 150 N tension force to the cone; and

(C) near-vertical wires, position the cone against a pair of wires at the widest opening between the wires, then apply the 150 N tension force to the cone.

(iii) Attempt to pull the cone through the gap between the wires under the 150 N load, and—

(A) increase the tension in the wires and repeat (ii) until such time as the cone will not pull through; or

(B) if it does not pull through, reduce the tension in the wires and repeat step (ii).

(iv) When the cone is just prevented from pulling through the gap, the wires are at the correct tension in which case the cone is withdrawn and the tension recorded.

(v) Reduce the tension in the wires and repeat steps (ii) to (iv) twice more, recording the tension in each case after the cone has been removed and then calculate the average of the three tensions as the required tension for each wire.

(vi) For prototype tests of horizontal or near horizontal wires, record the deflection of each wire at the average...
tension calculated in accordance with (v) when a 2 kg mass is hung at mid-span between supports.

(d) The test report must include the following information:

(i) The name and address of the person supervising the test.

(ii) The test report number.

(iii) The date of the test.

(iv) The wire manufacturer’s name and address, and specifications of the wires used in the test including the safe load limit of the wires.

(v) The construction details of the test specimen, including a description and drawings and details of the components including supports, post or railing spacings and wire spacings.

(vi) For a prototype test, the required tension calculated in accordance with (c)(v).

(vii) For prototype tests of horizontal or near horizontal wires, the deflection measured in accordance with (c)(vi).

Figure H5V1: Apparatus for testing wire barriers

Explanatory Information:

H5V1 is a means to verify that a proposed wire barrier satisfies the requirements of H5P2(2)(c) and (d).

The meaning of the phrase “prototype that is identical to that proposed to be installed” is similar to the testing of prototypes for fire resistance. That is the prototype and the installation must be identical with respect to the type of wire, the wire diameter, the number of lays, the wire tension, the post spacing and size, etc.

The test procedure is slightly different for barriers with horizontal or near horizontal wires and vertical wires or near vertical wires (see the test procedures set out in H5V1(c)(iii)).

H5V1(c)(vi) allows measuring deflection of wires to verify that the required tension has been achieved.

It should be noted that H5V1 is only one form of compliance solution which can be used to demonstrate compliance with H5P2(2)(c) and (d). The following means of verification are available:

• H5V1.

• The Deemed-to-Satisfy Provisions in Part 11.3 of the ABCB Housing Provisions.

• A Performance Solution that uses one of the other NCC Assessment Methods which verifies that H5P2(2)(c) and (d) will be achieved.
Deemed-to-Satisfy Provisions

H5D1 Deemed-to-Satisfy Provisions

[New for 2022]

(1) Where a Deemed-to-Satisfy Solution is proposed, Performance Requirements H5P1 and H5P2 are satisfied by complying with H5D2 and H5D3.

(2) Where a Performance Solution is proposed, the relevant Performance Requirements must be determined in accordance with A2G2(3) and A2G2(4) as applicable.

H5D2 Stairway and ramp construction

[2019: 3.9.1]

Compliance with Part 11.2 of the ABCB Housing Provisions satisfies Performance Requirement H5P1 for stairway and ramp construction.

H5D3 Barriers and handrails

[2019: 3.9.2]

Compliance with Part 11.3 of the ABCB Housing Provisions satisfies Performance Requirement H5P2 for barriers and handrails.
Introduction to this Part

This Part is intended to reduce greenhouse gas emissions from buildings. It addresses greenhouse gas emissions that occur as a result of how the building is designed and constructed; its energy use related to design and construction factors; and the source of the energy used.

Objectives

H6O1 Objective

The Objective is to reduce greenhouse gas emissions.

Functional Statements

H6F1 Greenhouse gas emissions

To reduce greenhouse gas emissions, to the degree necessary—

(a) a building, including its domestic services, is to be capable of efficiently using energy; and

(b) a building’s domestic services for heating are to obtain their energy from—

(i) a low greenhouse gas intensity source; or

(ii) an on-site renewable energy source; or

(iii) another process as reclaimed energy.

Explanatory Information:

1. The greenhouse gas intensity of energy sources varies. For example, natural gas has a low greenhouse gas intensity compared with electricity generated from coal.

2. For the purposes of H6F1, the renewable energy source must be on-site (so not Greenpower) and includes, but is not limited to, solar, wind, hydroelectric, wave action and geothermal.

Performance Requirements

VIC H6P1

H6P1 Building

A building must have, to the degree necessary, a level of thermal performance to facilitate the efficient use of energy for artificial heating and cooling appropriate to—

(a) the function and use of the building; and

(b) the internal environment; and

(c) the geographic location of the building; and
(d) the effects of nearby permanent features such as topography, structures and buildings; and
(e) solar radiation being—
   (i) utilised for heating; and
   (ii) controlled to minimise energy for cooling; and
(f) the sealing of the building envelope against air leakage; and
(g) the utilisation of air movement to assist cooling.

Explanatory Information:
In H6P1(d) the word ‘permanent’ is used to describe features that will have a long term impact on the building and includes natural features of the landscape, such as mountains and escarpments, while permanent man made features would be buildings likely to be in place for a long period of time.

VIC H6P2

H6P2 Services

Domestic services, including any associated distribution system and components must, to the degree necessary—

(a) have features that facilitate the efficient use of energy appropriate to—
   (i) the domestic service and its usage; and
   (ii) the geographic location of the building; and
   (iii) the location of the domestic service; and
   (iv) the energy source; and
(b) obtain heating energy from—
   (i) a source that has a greenhouse gas intensity that does not exceed 100 g CO\textsubscript{2}-e/MJ of thermal energy load; or
   (ii) an on-site renewable energy source; or
   (iii) another process such as reclaimed energy.

Explanatory Information:
1. For (a)(iv) the energy source can be a consideration if, for example, renewable energy such as electricity from a photovoltaic panel or a wind turbine was used to meet or supplement the lighting or cooling electricity load. For (b)(ii) similar sources could meet or supplement the heating load.
2. The intent of H6P2(b) is to constrain the use of a high greenhouse gas intensity source of energy. It does not prevent the use of electricity because the greenhouse gas intensity is related to the thermal load rather than the energy consumption which is covered by H6P2(a). H6P2 also contains the qualification that it is to be applied “to the degree necessary”, allowing electricity to be used, even by low efficiency plant when there are no reasonable alternatives.
3. For the purposes of H6P2 the renewable energy source must be on-site (so not Greenpower) and includes, but is not limited to, solar, wind, hydroelectric, wave action and geothermal.

Verification Methods

VIC H6V1

H6V1 Application of H6V2 and H6V3

The Verification Methods in this Part only apply to—
(a) a Class 1 building; and
(b) an enclosed Class 10a building attached to a Class 1 building.

Explanatory Information:

The Verification Methods in this Part are intended to apply to whole Class 1 buildings and to whole Class 1 buildings that incorporate attached and enclosed Class 10a parts, such as attached garages. The Verification Methods are not intended to apply to detached garages or to open carports.

H6V2 Verification using a reference building

(1) Compliance with H6P1 is verified when a proposed building—

(a) compared to a reference building, using a calculation method other than , has—
   (i) in climate zones 1 and 2, a cooling load equal to or less than that of the reference building; or
   (ii) in climate zones 7 and 8, a heating load equal to or less than that of the reference building; or
   (iii) in climate zones 3, 4, 5 and 6, a heating load and a cooling load equal to or less than that of the reference building; and
(b) complies with—
   (i) for building fabric thermal insulation, clause 13.2.2 of the ABCB Housing Provisions; and
   (ii) for thermal break, clauses 13.2.3(3) and 13.2.5(4) of the ABCB Housing Provisions; and
   (iii) for compensating for a loss of ceiling insulation, clauses 13.2.3(5) of the ABCB Housing Provisions; and
   (iv) for floor edge insulation, clauses 13.2.6(3) and 13.2.7(d) of the ABCB Housing Provisions; and
   (v) for building sealing, Part 13.4 of the ABCB Housing Provisions or H6V3.

(2) The heating loads and cooling loads in (1) must be calculated for the reference building using—

(a) internal heat gains from appliances and equipment of 5 W/m² averaged for 24 hours per day, 7 days per week; and
(b) an infiltration value of 0.6 air changes per hour; and
(c) the modelling criteria in Table H6V2.

(3) The heating load and cooling load for the proposed building and the reference building must be determined using the same—

(a) calculation method; and
(b) location specific data, including that of climate and topography appropriate to the location where the proposed building is to be constructed if the data is available, or the nearest location with similar climatic conditions in the same climate zone for which the data is available; and
(c) impact of adjoining structures and features; and
(d) soil conditions; and
(e) orientation; and
(f) floor plan, including the location and size of ; and
(g) number of storeys; and
(h) roof cladding and roof lights; and
(i) separating walls; and
(j) external non-glazed doors; and
(k) intermediate floors; and
(l) floor coverings; and
(m) internal heat gains from equipment and appliances; and
(n) air infiltration and ventilation; and
(o) function and use of the building and spaces, including zoning, hours of occupation, hours of heating and cooling availability; and

(p) space temperature settings within the ranges of 20°C to 21°C for heating and 25°C to 28°C for cooling; and

(q) the profiles for occupancy and air-conditioning.

(4) The calculation method used must comply with ANSI/ASHRAE Standard 140 and be capable of assessing the heating load and cooling load by modelling—

(a) the building fabric; and

(b) and shading; and

(c) air infiltration and ventilation; and

(d) the function and use of the building including zoning, hours of occupation, hours of heating and cooling availability and internal heat gains; and

(e) relevant built-environment and topographical features; and

(f) the sensible heat component of the cooling load and heating load.

(5) Climatic data employed in the calculation method must be based on hourly recorded values and be representative of a typical year for the proposed location.

### Table H6V2: Reference building requirements

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Criteria to be modelled</th>

### Explanatory Information:

1. The items listed in (3) must be the same for both the proposed building and reference building. This means that those factors applicable to the proposed building must be applied to the reference building. For example, if the
proposed building is subject to overshadowing by an existing adjoining building, in accordance with (3)(c) the same overshadowing must be applied to the *reference building*.

2. In (4)(d), the number of hours per day for which heating and cooling is available would be expected to lie between 8 and 17, with values outside this range unlikely in other than exceptional circumstances.

3. To comply with (3)(o) all internal zones need to be modelled for each internal area. For example, zones for *conditioned spaces*, unconditioned spaces, day time, night time and the like appropriate to their intended usage. It is expected that each room including significant hallways will be modelled as a separate thermal zone.

4. Suitable climatic data including dry-bulb temperature, direct and diffuse solar radiation, wind speed, wind direction and cloud cover can be obtained from the Australian national climate database.

### H6V3 Verification of building envelope sealing

[2019: V2.6.2.3]

Compliance with H6P1(f) is verified when a building *envelope* is sealed at an air permeability of not more than 10 m$^3$/hr.m$^2$ at 50 Pa reference pressure when tested in accordance with AS/NZS ISO 9972 Method 1.

**Explanatory Information:**
The intent is that 10 m$^3$/hr.m$^2$ at 50 Pa is broadly equivalent to 10 air changes per hour at 50 Pa when applied to homes. It should be noted that H6V3 is only one way of achieving compliance with H6P1(f). Other ways of complying include the following:

- The relevant provisions of Section 13 of the ABCB Housing Provisions.
- A *Performance Solution* that uses one of the other NCC *Assessment Methods* which verifies that compliance with H6P1(f) will be achieved.

### Deemed-to-Satisfy Provisions

#### H6D1 Deemed-to-Satisfy Provisions

[New for 2022]

(1) Where a *Deemed-to-Satisfy Solution* is proposed *Performance Requirements* H6P1 and H6P2 are satisfied by complying with H6D2 and H6D3; and

(2) Where a *Performance Solution* is proposed, the relevant *Performance Requirements* must be determined in accordance with A2G2(3) and A2G2(4) as applicable.

#### H6D2 Application of Part H6

[2019: 3.12.0]

(1) *Performance Requirement* H6P1 for the thermal performance of the building is satisfied by—

(a) complying with—

(i) *Specification 42*, for reducing the heating or cooling loads; and

(ii) Section 13 of the ABCB Housing Provisions, clauses—

(A) 13.2.2, for building *fabric* thermal insulation; and

(B) 13.2.3(3) and 13.2.5(4), for thermal breaks; and

(C) 13.2.3(6), for compensating for a loss of ceiling insulation, other than where the used can automatically compensate for a loss of ceiling insulation; and

(D) 13.2.6(3) and 13.2.6(4), for floor edge insulation; and

(E) Part 13.4, for building sealing; or
(b) complying with Section 13 of the ABCB Housing Provisions——

(i) Part 13.2, for the building fabric; and
(ii) Part 13.3, for the external and shading; and
(iii) Part 13.4, for building sealing; and
(iv) Part 13.5, for air movement.

(2) **Performance Requirement H6P2** for reducing greenhouse gas emissions is satisfied by complying with—

(a) Part 13.6 of the ABCB Housing Provisions; or
(b) for a heated water supply system, Part B2 of NCC Volume Three – Plumbing Code of Australia.

**VIC H6D2(3)**

**Explanatory Information:**

There are two options for complying with the energy efficiency **Deemed-to-Satisfy Provisions** of Parts 13.2 to 13.5 in the ABCB Housing Provisions:

- **Option 1 Energy Rating** — H6D2(1)(a)(i) to achieve the *required* energy rating and comply with H6D2(1)(a)(ii) for energy saving features such as the testing and installation of insulation, thermal breaks, compensation for downlights other than where the downlights can automatically compensate for a loss of ceiling insulation, floor edge insulation and detailed provisions for building sealing.

- **Option 2 Elemental Provisions** — H6D2(1)(b) to satisfy all the detailed provisions including meeting the *Total R-Values* of roofs, walls and floors, the *glazing* allowances and the air movement requirements. These detailed provisions also include the testing and installation of insulation, thermal breaks, compensation for downlights, floor edge insulation and detailed provisions for building sealing.
Introduction to this Part

This Part contains requirements which operate alongside the requirements of other Parts of NCC Volume Two, to address specific types of ancillary structures such as swimming pools, heating appliances and fireplaces, and private bushfire shelters. This Part also includes additional requirements for construction in alpine areas and bushfire prone areas.

Objectives

H7O1  Objective

The Objective is to—

(a) safeguard young children from drowning or injury in a swimming pool; and
(b) safeguard people from drowning or injury due to suction by a swimming pool water recirculation system; and
(c) safeguard the occupants from illness or injury caused by fire from heating appliances installed within the building; and
(d) safeguard the occupants from illness or injury in alpine areas from an emergency while evacuating the building; and
(e) protect a building from the effects of a bushfire; and
(f) reduce the likelihood of fatalities arising from occupants of a Class 1a dwelling not evacuating a property prior to exposure from a bushfire event.

Applications:

1. H7O1(a) and (b) only apply to a swimming pool with a depth of water more than 300 mm.
2. H7O1(f) only applies to a Class 10c building.

Functional Statements

H7F1  Swimming pool access

A swimming pool is to be provided with—

(a) means to restrict access to it by young children; and
(b) means to reduce the possibility of a person being entrapped or injured due to suction by a water recirculation system.

Applications:

H7F1 only applies to a swimming pool with a depth of water more than 300 mm.
### H7F2 Heating appliances

Heating appliances using controlled combustion located in a building are to be installed in a way which reduces the likelihood of—

(a) fire spreading beyond the appliance; and

(b) smoke from the appliance entering the building.

### H7F3 Alpine areas

A building in an alpine area is to be provided with additional measures in view of the increased difficulties in fighting fire and maintaining access and means of egress in snow conditions.

### H7F4 Bushfire areas

A Class 1 building or a Class 10a building or deck associated with a Class 1 building constructed in a designated bushfire prone area is to provide resistance to bushfires in order to reduce the danger to life and reduce the risk of the loss of the building.

### H7F5 Private bushfire shelters

A structure designed for emergency occupation during a bushfire event must provide shelter to occupants from direct and indirect actions of a bushfire.

#### Applications:

H7F5 only applies to a Class 10c building.

### Performance Requirements

**NSW H7P1**  
**NT H7P1**  
**QLD H7P1**

#### H7P1 Swimming pool access

A barrier must be provided to a swimming pool and must—

(a) be continuous for the full extent of the hazard; and

(b) be of a strength and rigidity to withstand the foreseeable impact of people; and

(c) restrict the access of young children to the pool and the immediate pool surrounds; and

(d) have any gates and doors fitted with latching devices not readily operated by young children, and constructed to automatically close and latch.
Applications:
H7P1 only applies to a swimming pool with a depth of water more than 300 mm.

H7P2 Swimming pool reticulation systems

[2019: P2.7.2]

A swimming pool water recirculation system must incorporate safety measures to avoid entrapment of, or injury to, a person.

Applications:
H7P2 only applies to a swimming pool with a depth of water more than 300 mm.

TAS H7P3

H7P3 Heating appliances

[2019: P2.7.3]

A heating appliance and its associated components within a building, including an open fire-place, chimney, or the like, must be installed—

(a) to withstand the temperatures likely to be generated by the appliance; and
(b) so that it does not raise the temperature of any building element to a level that would adversely affect the element’s physical or mechanical properties or function; and
(c) so that hot products of combustion will not—
   (i) escape through the walls of the associated components; and
   (ii) discharge in a position that will cause fire to spread to nearby combustible materials or allow smoke to penetrate through nearby windows, ventilation inlets, or the like in the building containing the heating appliance.

H7P4 Buildings in alpine areas

[2019: 2.7.4]

(1) An external doorway from a building in an alpine area must be installed so that opening the door is not obstructed by snow or ice.

(2) A building in an alpine area containing external trafficable structures forming part of the means of egress must be constructed so that they remain, as far as practicable, useable under snow conditions.

(3) A building in an alpine area must be constructed so that snow or ice is not shed from the building onto the allotment, any adjoining allotment, road or public space in a location or manner that will—
   (a) obstruct a means of egress from any building to a road or open space; or
   (b) otherwise endanger people.

TAS H7P5

H7P5 Buildings in bushfire prone areas

[2019: P2.7.5]

A Class 1 building or a Class 10a building or deck associated with a Class 1 building that is constructed in a must, to the degree necessary, be designed and constructed to reduce the risk of ignition from a bushfire, appropriate to the

(a) reduce the risk of ignition from design bushfire with annual probability of exceedance not greater than 1:50 years;
H7P6  Private bushfire shelters

A private bushfire shelter must be designed and constructed to provide a tenable environment for occupants during a design bushfire with an annual probability of exceedance not greater than 1:200 years, the passage of untenable conditions arising from a bushfire event, appropriate to the—

(a) location of the private bushfire shelter relative to fire hazards including—
   (i) predominant vegetation; and
   (ii) adjacent buildings and structures; and
   (iii) allotment boundaries; and
   (iv) other combustible materials; and
(b) occupancy of the private bushfire shelter; and
(c) bushfire intensity having regard for the bushfire attack level; and
(d) fire intensity from adjacent buildings and structures, allotment boundaries and other combustible materials; and
(e) ready access to the private bushfire shelter from the associated dwelling and occupant egress after the fire; and
(f) tenability within the private bushfire shelter for the estimated maximum period of occupancy; and
(g) generation of smoke, heat and toxic gases from materials used to construct the private bushfire shelter; and
(h) structural and fire loads and actions to which it may reasonably be subjected, appropriate to—
   (i) the topography between the private bushfire shelter and the predominant vegetation or other fire hazards; and
   (ii) the distance between the private bushfire shelter and the predominant vegetation or other fire hazards; and
   (iii) the size of the potential fire source and fire intensity; and
   (iv) wind loading; and
   (v) potential impact from debris such as falling tree limbs; and
   (i) degree of external signage identifying the location of the private bushfire shelter; and
   (j) degree of internal signage identifying the design capacity and maximum period of occupancy; and
   (k) degree of occupant awareness of outside environmental conditions; and
   (l) degree of essential maintenance.

Applications:
H7P6 only applies to a Class 10c building.

Notes:
H7V1  Combustion appliances

Compliance with H7P3(a) and (b) is verified when—

(a) components used within an appliance and its installation are constructed from—
   (i) heat-resistant materials for maximum operating temperatures more than 600°C, where the material complies
       with (c); or
   (ii) heat-tolerant materials for maximum operating temperatures more than 150°C and less than 600°C, where
       the material complies with (c); and

(b) the building elements surrounding the appliance maintain their designed function and material properties inclusive
    of a full range of thermal movements when exposed to the heat effects of the appliance; and

(c) a sample of the material is tested to the maximum operating temperature, specified in (a)(i) or (a)(ii) for a
    minimum of 96 hours; and

(d) the tested sample, when allowed to cool, must be free from—
   (i) visible cracks and fractures; and
   (ii) visible indication of de-lamination; and
   (iii) linear distortion in excess of the equivalent of 10 mm per metre, and
   (iv) deterioration of the appearance of any surface finish, when compared to an unheated sample.

Explanatory Information:
Under H7V1, the user needs to demonstrate that the proposed appliance will not deteriorate under standard operating
conditions. Examples of deterioration may include deformation or failure of components that would render the appliance
unsafe to use.

For the purposes of demonstrating compliance with (a), the typical operating temperature of a combustion device can
be established by testing.

For the purposes of demonstrating compliance with (b), materials used for building elements (walls, floors and ceiling)
in the areas surrounding an appliance can be appropriately selected and/or designed to align with the quantified values
as determined by (a). This could either be achieved by using Expert Judgement or by adhering to manufacturer’s
specifications. Certification in accordance with CodeMark Australia would also be a possibility in demonstrating
compliance using the Verification Method.

Full range of thermal movements relates to both the appliance and materials when exposed to both the heated and
ambient conditions,

Benefits to industry derived from the application of this Verification Method includes the potential use of non-standard
national or internationally manufactured appliances. For example, test reports from appliances complying with various
ISO Standards and various British Standards could be used to demonstrate compliance with the Verification Method.
The Verification Method also allows for in situ testing of unique combustion appliances, which would not easily be tested
in accordance with the Australian Standard. Such testing would need to be verified by a suitably qualified practitioner
and be supported by appropriate documentation.

H7V2  Buildings in bushfire prone areas

(1) Compliance with H7P5 is verified if the ignition probability for a building exposed to a design bushfire does not exceed
    10%.

(2) Bushfire design actions must be determined in consideration of the annual probability of a design bushfire derived
    from—
    (a) assigning the building or structure with an importance level in accordance with (3); and
    (b) determining the corresponding annual probability of exceedance in accordance with Table H7V2.

(3) A building or structure’s importance level must be identified as one of the following:
(a) Importance level 1 — where the building or structure presents a low degree of hazard to life and other property in the case of failure.

(b) Importance level 2 — where the building or structure is not of importance level 1 or 4 and is a Class 1a or 1b building accommodating 12 people or less.

(c) Importance level 4 — where the building is a Class 10c building and is subject to a necessary ‘defend in place’ strategy.

(4) The ignition probability for a building must be assessed by application of the following:

(a) An event tree analysis of relevant bushfire scenarios.

(b) Design bushfire conditions that include combinations of the following actions appropriate to the distance between the building and the bushfire hazard:
   (i) Direct attack from airborne burning embers.
   (ii) Burning debris and accumulated embers adjacent to a building element.
   (iii) Radiant heat from a bushfire front.
   (iv) Direct flame attack from a bushfire front.

(5) Applied fire actions must allow for reasonable variations in—

(a) fire weather; and

(b) vegetation, including fuel load, burning behaviour of vegetation (including the potential for crown fires); and

(c) the distance of the building from vegetation; and

(d) topography, including slopes and features that may shield; and

(e) ignition of adjacent buildings, building elements, plants, mulch and other materials; and

(f) effective size of fire front; and

(g) duration of exposure; and

(h) flame height; and

(i) flame tilt; and

(j) flame adhesion to sloping land; and

(k) the height of the building and its elements.

(6) The assessment process must include consideration of—

(a) the probability of non-complying construction of critical aspects of an approved design; and

(b) the probability of critical aspects of an approved design being fully functional during the life of the building; and

(c) inclusion of safety factors; and

(d) sensitivity analysis of critical aspects of a proposed design.

Table H7V2: Annual Probability of Exceedance (APE) for design bushfire actions

Table Notes:
Complex analysis must consider the probability of ignition, fire spread to the urban interface and penetration of the urban interface coincident with fire weather conditions.

Explanatory Information:
NCC Volume Two does not apply to buildings that are importance level 3, therefore this importance level is not included.
Deemed-to-Satisfy Provisions

H7D1 Deemed-to-Satisfy provisions

(1) Where a Deemed-to-Satisfy Solution is proposed, Performance Requirements H7P1 to H7P5 are satisfied by complying with H7D2 to H7D5.

(2) Where a Performance Solution is proposed, the relevant Performance Requirements must be determined in accordance with A2G2(3) and A2G2(4) as applicable.

(3) If a private bushfire shelter is installed, it must comply with Performance Requirement H7P6.

Notes:
There are no Deemed-to-Satisfy Provisions for H7P6.

NSW H7D2

H7D2 Swimming pools

[2019: 3.10.1]

NT H7D2(1)
QLD H7D2(1)

(1) Performance Requirement H7P1 is satisfied for a swimming pool with a depth of water more than 300 mm and which is associated with a Class 1 building, if it has safety barriers installed in accordance with AS 1926.1 and AS 1926.2.

(2) Performance Requirement H7P2 is satisfied for a water recirculation system of a swimming pool with a depth of water more than 300 mm, if it complies with AS 1926.3.

SA H7D2(3)

Explanatory Information: Definition of ‘swimming pool’
The NCC definition of swimming pool is specific in including a bathing or wading pool and a spa. The requirements of AS 1926.3 apply to all types of pools defined as swimming pools under the BCA, irrespective of the definition in the Standard.

Explanatory Information: Water recirculation systems
The swimming pool water recirculation system requirements seek to minimise the risk of entrapment or injury of people using the swimming pool and provide for the safe operation of skimmer boxes and outlet systems.

Explanatory Information: Additional requirements
Part 13.6 of the ABCB Housing Provisions contains requirements for swimming pool and spa pool heating and pumping. In specific circumstances, Part 13.6 requires a swimming pool or spa pool to have a cover to reduce evaporation and subsequent heat loss, and time switches to control the operation of the heater.

In addition to the requirements of this Part, a swimming pool must comply with the structural requirements of other Parts of NCC Volume Two and the ABCB Housing Provisions. The structural requirements refer to the swimming pool being designed and constructed to withstand any combinations of loads and other actions to which it may reasonably be subjected and the structural resistance of the materials and forms of construction used in the swimming pool.

Explanatory Information: Cross-volume considerations
Part C2 of NCC Volume Three sets out the requirements for pumped discharge from swimming pools.
H7D3  Construction in alpine areas

(1) Compliance with Part 12.2 of the ABCB Housing Provisions satisfies Performance Requirement H7P4 for buildings that are located in alpine areas.

(2) The Deemed-to-Satisfy Provisions of this Part apply in addition to other Deemed-to-Satisfy Provisions of NCC Volume Two and the ABCB Housing Provisions.

(3) Where any Deemed-to-Satisfy Provisions are in conflict, the provisions of H7D3 take precedence.

NSW H7D4

H7D4  Construction in bushfire prone areas

(1) The requirements of (2) only apply in a designated bushfire prone area.

(2) Performance Requirement H7P5 is satisfied for a Class 1 building, or a Class 10a building or deck associated with a Class 1 building, if it is constructed in accordance with—

(a) AS 3959; or

(b) NASH Standard – Steel Framed Construction in Bushfire Areas.

QLD H7D4(3)

H7D5  Boilers, pressure vessels, heating appliances, fireplaces, chimneys and flues

Performance Requirement H7P3 is satisfied a heating appliance if it is installed in accordance with—

(a) for a domestic solid fuel burning appliance, AS/NZS 2918; or

(b) for a heating appliance, Part 12.4 of the ABCB Housing Provisions.

Explanatory Information:

H7D5 applies to three types of heating appliances and includes the following:

1. Open fireplaces — where solid fuel such as timber or coals are burnt in an unenclosed compartment. The requirements in the Part 12.4 of the ABCB Housing Provisions for open fireplaces relate to masonry or concrete construction for all parts including the hearth, external faces and walls forming the back and sides and chimney.

2. Insert fireplaces — manufactured and assembled in factories and inserted into the openings of masonry fireplaces in a building. All insert fireplaces must be tested to AS/NZS 2918 and have closed fire compartments for the burning of solid fuels.

3. Free standing heating appliances — manufactured and assembled in factories and installed in the building without being concealed by wall or floor elements. All free standing fireplaces must be tested to AS/NZS 2918 and are required to be positioned in a building that meets specific minimum distances from internal building elements.

The requirements of both the H7D5(1) and Part 12 of the ABCB Housing Provisions in H7D5 are intended to ensure the construction or installation of heating appliances can withstand the temperatures they generate. The requirements also ensure there is no spread of fire from within the heating appliance to adjacent building elements.

In addition to this, the requirements ensure hot products of combustion and smoke do not affect the occupants within the building. This is achieved by requiring construction and installation of heating appliances to transfer products of combustion and smoke directly to the outside atmosphere.

Insert fireplaces fueled by gas are not covered by Part 12.4 of the ABCB Housing Provisions. Insert gas fireplaces may be regulated by relevant authorities responsible for gas installations in each State or Territory jurisdiction and may be
required to comply with AS 5601 – Gas installations.
Part H8  Livable housing design

Introduction to this Part

This Part sets requirements for dwellings to include features that are designed to improve their accessibility and usability for occupants and visitors, including those with a mobility-related disability.

Objectives

H8O1  Objective

The Objective of this Part is to ensure that housing is designed to meet the needs of the community, including older Australians and those with a mobility-related disability.

Applications:
H8O1 only applies to Class 1a buildings.

Functional Statements

H8F1  Livable housing design

A dwelling should be designed such that it is—

(a)  easy to enter; and
(b)  easy to navigate in and around; and
(c)  capable of easy and cost effective adaptation; and
(d)  responsive to the changing needs of occupants.

Explanatory Information:
H8F1 only applies to Class 1a buildings.

Performance Requirements

H8P1  Livable housing design

A Class 1a building must be provided with—

(a)  a safe, continuous and step-free path to a dwelling entrance door from either—
    (i)  the pedestrian entry at the allotment boundary; or
    (ii)  an appurtenant Class 10a garage or carport; or
    (iii)  a car parking space provided for the exclusive use of the occupants of the dwelling; and
(b)  at least one level and step-free entrance door into the dwelling from the access path required by (a); and
internal doors and corridors which facilitate unimpeded movement between spaces; and

(d) a sanitary compartment that—
   (i) facilitates independent access and use; and
   (ii) is located on the ground or entry level; and

(e) a shower that—
   (i) facilitates independent access and use; and
   (ii) is located on the ground or entry level; and

(f) the walls of the sanitary compartment referred to in (d) and the shower referred to in (e) constructed so as to facilitate future installation of grabrails, or the like, in a way that minimises the removal of existing wall linings.

Exemptions:

H8P1(a) need not be complied with if—

(a) step-free access cannot be provided from an appurtenant Class 10a garage or carport or a car parking space provided for the exclusive use of the occupants of the dwelling; and

(b) due to site conditions, there is no other suitable location on which to construct the access path.

Deemed-to-Satisfy Provisions

H8D1 Deemed-to-Satisfy Provisions

[New for 2022]

(1) Where a Deemed-to-Satisfy Solution is proposed, Performance Requirement H8P1 is satisfied by complying with H8D2.

(2) Where a Performance Solution is proposed, the relevant Performance Requirements must be determined in accordance with A2G2(3) and A2G4(3).

H8D2 Livable housing design

[New for 2022]

(1) A Class 1a dwelling must comply with the ABCB Standard for Livable Housing Design.

(2) Clause 1.1 of the ABCB Standard for Livable Housing Design need not be complied with if—
   (a) it is not practicable to provide step-free access via an appurtenant garage, carport or parking space in accordance with Clause 1.1(1)(b) or (c); and
   (b) one or more of the following is true:
      (i) The average slope of the ground on which the access path would be constructed exceeds a gradient of 1:14.
      (ii) To provide an external step-free access path would necessitate construction of ramping that exceeds the length and gradient allowed by Clause 1.1(4).
      (iii) There is insufficient space available on the site on which to construct a step-free access path complying with Clause 1.1.

(3) Even if Clause 1.1 is not complied with, all other relevant provisions of the ABCB Standard for Livable Housing Design must still be complied with.

Explanatory Information: Exemptions

The exemptions listed at H8D2(2)(b)(i) and (ii) provide for situations where the ramping necessary to provide a step-free access path would become too lengthy or too steep to be used regularly by a person with limited mobility, and therefore would offer little benefit to dwelling occupants or visitors. Such situations may occur due to a number of factors.
including (but not limited to):

- The slope of the land upon which the ramp would be constructed. For example, where the land is too steep for the ramp to run straight up, meaning it would instead need to be cut into the slope, or run back and forth across the face of the slope, in order to stay within maximum gradient limits.

- The height of the lowest floor containing habitable rooms is too high to be reached by a ramp within required length and gradient limits. Floor heights can be influenced by factors such as dwelling style, defined flood level, location of the dwelling in an alpine area, or construction of the dwelling directly above a private garage (including garage-top dwellings).

The exemption listed at H8D2(2)(b)(iii) provides for situations where the amount of available space on the site is insufficient to accommodate a step-free access path. This may be due to the physical size of the site, or regulations outside of the NCC which limit the proportion of a site that can be covered by structures and/or impervious ground coverings.

It is important to note that under H8D2(2), an exemption may only be applied if in a particular case both (a) and (b) are applicable, not just one of the other.
S42C1  Scope

This Specification sets out requirements for reducing heating and cooling loads.

S42C2  Heating and cooling loads

SA S42C2(1)
(1) A building must achieve an energy rating, including the separate heating and cooling load limits, using , of greater than or equal to—
   (a) 6 stars; or
   (b) for a building in climate zones 1 or 2, 5.5 stars if the building has an outdoor living area as described in (3) if the outdoor living area—
      (i) is fully covered with an impervious roof having a greater than or equal to 1.5 (for downward heat flow); or
      (ii) has at least one permanently installed ceiling fan; or
   (c) for a building in climate zones 1 or 2, 5 stars if the building has an outdoor living area as described in (3) if the outdoor living area—
      (i) is fully covered with an impervious roof having a greater than or equal to 1.5 (for downward heat flow); and
      (ii) has at least one permanently installed ceiling fan.

(2) The heating and cooling load limits in (1) are specified in the ABCB Standard for NatHERS Heating and Cooling Load Limits.

(3) An outdoor living area in (1)(b) and (1)(c) is a space that—
   (a) is directly adjoining, and directly accessible from, a general purpose living area of a Class 1 building such as a lounge, kitchen, dining or family room, which is not a room for sleeping or specialist tasks such as a study or home theatre; and
   (b) has a floor area greater than or equal to 12.0 m\(^2\); and
   (c) has length and width dimensions greater than or equal to 2.5 m each; and
   (d) has an opening height above floor level greater than or equal to 2.1 m; and
   (e) has one side permanently open with a second side either—
      (i) permanently open; or
      (ii) readily openable.

(4) The sides referred to in (1)(e) must be greater than or equal to 900 mm from an allotment boundary or 900 mm from an obstruction to the breeze path such as a building, fence or other structure.

(5) Where a ceiling fan is required as part of compliance with (1)(b) or (1)(c), the fan must comply with clause 13.5.4 of the ABCB Housing Provisions.

SA S42C2(6)
SA S42C2(7)
SA Table S42C2

Explanatory Information: Complying with S42C2(1)
1. To comply with (1), the modelled energy loads of a building must not exceed three separate load limits, i.e.—
   a. the total load limit corresponding to the applicable star rating; and
   b. the heating load limit; and
c. the cooling load limit.

4. To comply with (1)(b), either insulate the roof of the outdoor living area, or provide a ceiling fan.

5. To comply with (1)(c), insulate the roof of the outdoor living area and provide a ceiling fan.

6. The options for complying with H6D3(1) are shown in the flowchart in explanatory Figure S42C2.
Figure S42C2 (explanatory): Flowchart for complying with S42C2(1)

How will you meet P2.6.1?  
Note that P2.6.2 needs to be met also.

Option 1  
Using an energy rating

Are you in BCA Climate Zone 1 or 2?

YES

Does the building have an outdoor living area complying with 3.12.0.1(c)?

YES

Does the outdoor living area have a fan complying with 3.12.4.3?

YES

Is the outdoor living area fully covered with an impervious roof of at least R1.5 down?

YES

An energy rating of greater than or equal to 5 stars including separate heating and cooling load limits is required.  
Additional provisions listed in 3.12.0(a)(i) and 3.12.0(b) also apply.

NO

NO

NO

NO

NO

NO

NO

NO

NO

NO

NO

NO

An energy rating of greater than or equal to 6 stars including the separate heating and cooling load limits is required.  
Additional provisions listed in 3.12.0(a)(i) and 3.12.0(b) also apply.

Option 2  
Using elemental provisions

Explanatory Information: Outdoor living areas

1. The opening height in (3)(d) is to provide a breeze path and is likely to be the measurement from the floor to the...
underside of a perimeter beam. It is not a ceiling height measurement. It is also not a height for mounting a ceiling fan or the height of ceiling fan blades above the floor. These dimensions need to be determined considering the activities in the space, the safety of occupants of the space and any appropriate safety standards.

2. There is some survey evidence that suggests the majority of home owners turn off their air-conditioners when using an outdoor living area. Another cost effective option is to install a reed switch or other micro switch on the door leading to the outdoor living area in order to automatically deactivate an air-conditioning unit when the door is left open for a period which allows occupants to enter and leave the air-conditioned space but does not affect the operation of the air-conditioner.

3. A side referred to in (3)(e) may contain some obstructions such as columns and barriers. Where an open side is required to have a 1 m barrier, consideration as to the type (wire, solid or other) should be made with regard to the overall opening area of the two sides.

</table>
Above ground rainwater tank: A rainwater tank that is not in any way set into the ground.

Accessible: Having features to enable use by people with a disability.

Accessway: A continuous accessible path of travel (as defined in AS 1428.1) to, into or within a building.

Accredited Testing Laboratory: One of the following:
(a) An organisation accredited by the National Association of Testing Authorities (NATA) to undertake the relevant tests.
(b) An organisation outside Australia accredited to undertake the relevant tests by an authority recognised by NATA through a mutual recognition agreement.
(c) An organisation recognised as being an Accredited Testing Laboratory under legislation at the time the test was undertaken.

Activity support level: The degree to which occupants can undertake activities with respect to the likely activity traits and occupant traits.

Explanatory Information:
This term is used to articulate whether the height of a room or space is sufficient and by what degree. This is achieved by having regard to the room or space’s intended use by occupants, through consideration of the defined terms ‘activity traits’ and ‘occupant traits’.

(a) For the purposes of Volume One, the features of the activities that will be undertaken in a habitable room or space.
(b) For the purposes of Volume Two, the features of the activities that will be undertaken in a room or space.

Explanatory Information:
This term is used to describe the characteristics of the activities that will be undertaken in a room or space.

For example, the activities likely to be undertaken in a bedroom, and the associated features are—
- sleeping — a person laying horizontally; and
- resting — a person laying horizontally or sitting upright on the bed; and
- leisure activities, such as reading a book — a person sitting upright on the bed, with enough space to stretch their arms vertically; and
- dressing/changing clothes — a person standing with enough space to stretch their arms vertically.

Administering body: The body responsible for administering the WaterMark Certification Scheme.

Aged care building: A Class 9c building for residential accommodation of aged persons who, due to varying degrees of incapacity associated with the ageing process, are provided with personal care services and 24 hour staff assistance to evacuate the building during an emergency.

NSW

Air-conditioning: For the purposes of Section J of Volume One, a service that actively cools or heats the air within a space, but does not include a service that directly—
(a) cools or heats cold or hot rooms; or
(b) maintains specialised conditions for equipment or processes, where this is the main purpose of the service.

Alarm zone: For the purposes of Specification 23, an area of a building protected by one or more smoke alarms connected to one alarm circuit.

Alteration: In relation to a building, includes an addition or extension to a building.

Aluminium Composite Panel (ACP): Flat or profiled aluminium sheet material in composite with any type of materials.

Amenity: An attribute which contributes to the health, physical independence, comfort and well-being of people.
Ancillary element: An element that is secondary to and not an integral part of another element to which it is attached.

Annual exceedance probability: The probability that a given rainfall total accumulated over a given duration will be exceeded in any one year.

Annual greenhouse gas emissions: The theoretical amount of greenhouse gas emissions attributable to the energy used annually by a building’s services, excluding kitchen exhaust and the like.

Appropriate authority: For the purposes of the Fire Safety Verification Method, means the relevant authority with the statutory responsibility to determine the particular matter satisfies the relevant Performance Requirement.

Explanatory Information:
The Appropriate Authority is typically the building surveyor or building certifier charged with the statutory responsibility to determine building compliance and issue the building permit / approval and occupancy certificate / approval.

NSW Appropriate authority

Appropriate authority: The relevant authority with the statutory responsibility to determine the particular matter.

Appropriately qualified person: A person recognised by the appropriate authority as having qualifications and/or experience in the relevant discipline in question.

Approved disposal system: A system for the disposal of sewage, sullage or stormwater approved by an authority having jurisdiction.

Articulated masonry: Masonry construction in which special provisions have been made for movement by articulation.

NSW Assembly building

Assembly building: A building where people may assemble for—

(a) civic, theatrical, social, political or religious purposes including a library, theatre, public hall or place of worship; or

(b) educational purposes in a school, early childhood centre, preschool, or the like; or

(c) entertainment, recreational or sporting purposes including—

(i) a discotheque, nightclub or a bar area of a hotel or motel providing live entertainment or containing a dance floor; or

(ii) a cinema; or

(iii) a sports stadium, sporting or other club; or

(d) transit purposes including a bus station, railway station, airport or ferry terminal.

Assessment Method: A method that can be used for determining that a Performance Solution or Deemed-to-Satisfy Solution complies with the Performance Requirements.

Atrium: A space within a building that connects 2 or more storeys and—

(a) is enclosed at the top by a floor or roof (including a glazed roof structure); and

(b) includes any adjacent part of the building not separated by an appropriate barrier to fire; but

(c) does not include a stairwell, rampwell or the space within a shaft; and

(d) for the purposes of (a) a space is considered enclosed if the area of the enclosing floor or roof is greater than 50% of the area of the space, measured in plan, of any of the storeys connected by the space.

Atrium well: A space in an atrium bounded by the perimeter of the openings in the floors or by the perimeter of the floors and the external walls.

Automatic: Designed to operate when activated by a heat, smoke or fire sensing device.

(a) The time between ignition of a fire and the onset of untenable conditions in a specific part of a building.

(b) The time referred to in (1) is the calculated interval between the time of ignition of a fire and the time at which conditions become such that the occupant is unable to take effective action to escape to a place of safety.

Average daylight factor: The ratio of the illumination level within a room provided by daylight to the level of daylight outside the building during overcast conditions.
Average recurrence interval: Applied to rainfall, means the expected or average interval between exceedances for a 5 minute duration rainfall intensity.

Average specific extinction area: The average specific extinction area for smoke as determined by AS 5637.1.

Backflow prevention device: An air gap, break tank or mechanical device that is designed to prevent the unplanned reversal of flow of water or contaminants into the water service or a Network Utility Operator’s water supply.

Backpressure: A reversal of water flow caused by the downstream pressure becoming greater than the supply pressure.

Backsiphonage: A reversal of flow of water caused by negative pressure in the distributing pipes of a water service or supply.

Backstage: A space associated with, and adjacent to, a stage in a Class 9b building for scenery, props, equipment, dressing rooms, or the like.

Battery system: One or more chemical cells connected in series, parallel or a combination of the two for the purpose of electrical energy storage.

Blockage: An obstruction within a water service or sanitary plumbing or drainage system.

Boiler: A vessel or an arrangement of vessels and interconnecting parts, wherein steam or other vapour is generated, or water or other liquid is heated at a pressure above that of the atmosphere, by the application of fire, the products of combustion, electrical power, or similar high temperature means, and—

(a) includes superheaters, reheaters, economisers, boiler piping, supports, mountings, valves, gauges, fittings, controls, the boiler settings and directly associated equipment; but

(b) excludes a fully flooded or pressurised system where water or other liquid is heated to a temperature lower than the normal atmospheric boiling temperature of the liquid.

Bond breaker: A material used as part of a waterproofing system that prevents the membrane bonding to the substrate, bedding or lining.

Breaking surf: Any area of salt water in which waves break on an average of at least 4 days per week but does not include white caps or choppy water.

Explanatory Information:

Breaking surf normally occurs in areas exposed to the open sea. Breaking surf does not normally occur in sheltered areas, such as that which occurs around Port Phillip Bay, Sydney Harbour, Swan River, Derwent River and similar locations.

Brittle failure: Loss of strength to resist design actions without first undergoing significant deformation which, for the purposes of the Performance Requirements, may be taken to include (but is not limited to) buckling, fatigue failure and soil bearing failure.

Building complexity criteria: Are used to determine whether all or part of a building is low, medium, high or very high building complexity — the building complexity criteria are:

(a) Attributes — the building is designed or constructed with any of the following sub-criteria:

(i) An effective height of more than 25 m.

(ii) One or more Performance Solutions used to demonstrate compliance with Performance Requirements relating to material and systems for structural safety.

(iii) One or more Performance Solutions used to demonstrate compliance with Performance Requirements relating to material and systems for fire safety.

(iv) In an area prone to natural disaster or adverse environmental conditions.

(b) Class 2 — all or part of the building is Class 2 of three or more storeys.

(c) Occupant numbers — the building is to occupied by more than 100 people determined in accordance with D2D18.

(d) Occupant characteristics — the building is to be occupied by more than 10 people who will require assistance to evacuate the building in an emergency.

(e) Building Importance Level 4 — the building is determined to be Importance Level 4 in accordance with Table B1D3a.

Building complexity: high: Where a building meets three of building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), or (d) (Occupant characteristics).
**Building complexity: low:** Where a building meets one only of building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), or (d) (Occupant characteristics).

**Building complexity: medium:** Where a building meets two of building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), or (d) (Occupant characteristics).

**Building complexity: very high:** Where a building meets—

(a) all building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), and (d) (Occupant characteristics); or

(b) building complexity criterion (e) (Building Importance Level 4).

**Notes:**

The NCC currently does not include corresponding technical requirements relating to the defined term ‘building complexity criteria’ and the various building complexity levels. It is intended that these terms will be integrated into future editions of the NCC.

**Buried rainwater tank:** A rainwater tank that is set into and completely covered by earth.

**Burnout:** Exposure to fire for a time that includes fire growth, full development, and decay in the absence of intervention or automatic suppression, beyond which the fire is no longer a threat to building elements intended to perform loadbearing or fire separation functions, or both.

**Carpark:** A building that is used for the parking of motor vehicles but is neither a private garage nor used for the servicing of vehicles, other than washing, cleaning or polishing.

**Cavity:** A void between 2 leaves of masonry, or in masonry veneer construction, a void between a leaf of masonry and the supporting frame.

**Cavity wall:** For the purposes of F1V1 and H2V1, a wall that incorporates a drained cavity.

**Certificate of Accreditation:** A certificate issued by a State or Territory accreditation authority stating that the properties and performance of a building material or method of construction or design fulfil specific requirements of the NCC.

**Certificate of Conformity:** A certificate issued under the ABCB scheme for products and systems certification stating that the properties and performance of a building material or method of construction or design fulfil specific requirements of the NCC.

**Certification body:** A person or organisation operating in the field of material, product, form of construction or design certification that has been accredited by the Joint Accreditation System of Australia and New Zealand (JAS-ANZ), and is accredited for a purpose other than as part of the CodeMark Australia Certification Scheme or WaterMark Certification Scheme.

**Characteristic:** The occupant data to be used in the modelling of access solutions which define how an occupant interacts with a building, i.e. occupant movement speeds, turning ability, reach capability, perception of luminance contrast and hearing threshold.

**Clad frame:** Timber or metal frame construction with exterior timber or sheet wall cladding that is not sensitive to minor movement and includes substructure masonry walls up to 1.5 m high.

**Climate zone:** Climate zone means an area defined in Figure 2 and in Tables 2a to 2h for specific locations, having energy efficiency provisions based on a range of similar climatic characteristics.

Figure 2: Climate zones for thermal design

Figure Notes:
(a) This map can be viewed in enlargeable form on the ABCB website at abcb.gov.au.
(b) A Zone 4 area in South Australia, other than a council area, at an altitude greater than 300 m above the Australian Height Datum is to be considered as Zone 5.
(c) The areas referred to in (2) have been defined in an enlarged format on the following maps produced by the Department of Planning, Transport and Infrastructure (these maps can be viewed on the Government of South Australia website at www.sa.gov.au):
   (i) Adelaide Hills Climate Zone Map.
   (ii) Barossa Council Climate Zone Map.
   (iii) Regional Council of Goyder Climate Zone Map.
(d) Locations in climate zone 8 are in alpine areas.

Combustible: Applied to—
(a) a material — means combustible as determined by AS 1530.1; and
(b) construction or part of a building — means constructed wholly or in part of combustible materials.
(a) For the purposes of Volume One, a wall that is common to adjoining buildings.
(b) For the purposes of Volume Two and the ABCB Housing Provisions, a wall that is common to adjoining buildings other than Class 1 buildings.

Condensation: The formation of moisture on the surface of a building element or material as a result of moist air coming into contact with a surface which is at a lower temperature.
(a) For the purposes of Volume One, a space within a building, including a ceiling or under-floor supply air plenum or return air plenum, where the environment is likely, by the intended use of the space, to have its temperature controlled by air-conditioning.
(b) For the purposes of Volume Two, a space within a building that is heated or cooled by the building’s domestic services, excluding a non-habitable room in which a heater with a capacity of not more than 1.2 kW or 4.3 MJ/hour is installed.

Connections: The parts that fix the members into the structure, through which the loads pass.
Construction activity actions: Actions due to stacking of building materials or the use of equipment, including cranes and trucks, during construction or actions which may be induced by floor to floor propping.

Containment protection: The installation of a backflow prevention device at the point of connection of a Network Utility Operator’s water supply to a site.

Contaminant: Any substance (including gases, liquids, solids or micro-organisms), energy (excluding noise) or heat, that either by itself or in combination with the same, similar or other substances, energy or heat, changes or is likely to change the physical, chemical or biological condition of water.

Controlled fill: Material that has been placed and compacted in layers with compaction equipment (such as a vibrating plate) within a defined moisture range to a defined density requirement.

Cooling load: The calculated amount of energy removed from the cooled spaces of the building annually by artificial means to maintain the desired temperatures in those spaces.

Critical radiant flux (CRF): The critical heat flux at extinguishment (CHF in kW/m²) as determined by AS ISO 9239.1.

Cross-connection: Any actual or potential connection between a water supply and any contaminant.

Curtain wall: A non-loadbearing external wall that is not a panel wall.

Damp-proof course (DPC): A continuous layer of impervious material placed in a masonry wall or pier, or between a wall or pier and a floor, to prevent the upward or downward migration of water.

Deemed-to-Satisfy Provisions: Provisions which are deemed to satisfy the Performance Requirements.

Defined flood event (DFE): The flood event selected for the management of flood hazard for the location of specific development as determined by the appropriate authority.

Defined flood level (DFL): The flood level associated with a defined flood event relative to a specified datum (see Figure 3).
**Definitions**

**NSW Designated bushfire prone area**

**Designated bushfire prone area:** Land which has been designated under a power of legislation as being subject, or likely to be subject, to bushfires.

**Design bushfire:** The characteristics of a bushfire, its initiation, spread and development, which arises from weather conditions, topography and fuel (vegetation) in a given setting, used to determine fire actions.

**Design fire:** The quantitative description of a representation of a fire within the design scenario.

**Design scenario:** The specific scenario of which the sequence of events is quantified and a fire safety engineering analysis is conducted against.

**Design wind speed:** The design gust wind speed for the area where the building is located, calculated in accordance with AS/NZS 1170.2 or AS 4055 (see Table 43 for wind classes).

### Wind classes

<table>
<thead>
<tr>
<th>Non-cyclonic Region A and B</th>
<th>Cyclonic Region C and D</th>
</tr>
</thead>
<tbody>
<tr>
<td>N1, N2, N3</td>
<td>C1</td>
</tr>
<tr>
<td>N4, N5, N6 (these wind classes are covered in the Housing Provisions Part 2.2, Structural provisions.)</td>
<td>C2, C3, C4 (these wind classes are covered in the Housing Provisions Part 2.2, Structural provisions).</td>
</tr>
</tbody>
</table>

**Table Notes:**

(a) Wind classification map identifying wind regions is contained in Housing Provisions Part 2.2 (see Figure 2.2.3).

(b) Information on wind classes for particular areas may be available from the appropriate authority.
(c) “N” = non-cyclonic winds and “C” = cyclonic winds.

**Detention centre**: A building in which persons are securely detained by means of the built structure including a prison, remand centre, juvenile detention centre, holding cells or psychiatric detention centre.

**Direct fix cladding wall**: For the purposes of F1V1 and H2V1, means a wall with cladding attached directly to the wall framing without the use of a drained cavity.

(a) A wall having a minimum 20 mm cavity between 2 separate leaves, and—
   (i) for masonry, where wall ties are used to connect leaves, the ties are of the resilient type; and
   (ii) for other than masonry, there is no mechanical linkage between the leaves, except at the periphery.

(b) A staggered stud wall is not deemed to be discontinuous construction.

**Display glazing**: Glazing used to display retail goods in a shop or showroom directly adjacent to a walkway or footpath, but not including that used in a café or restaurant.

**Domestic services**: The basic engineering systems that use energy or control the use of energy; and—

(a) includes—
   (i) heating, air-conditioning, mechanical ventilation and artificial lighting; and
   (ii) pumps and heaters for swimming pools and spa pools; and
   (iii) heated water systems; but

(b) excludes cooking facilities and portable appliances.

**Drainage**: Any part of—sanitary drainage, liquid trade waste drainage or stormwater drainage system.

(a) a sanitary drainage system, including any liquid trade waste drainage; or

(b) a stormwater drainage system.

**Drainage flange**: A flange connected to a waste pipe, at the point at which it passes through the floor substrate, to prevent leakage and which enables tile bed drainage into the waste pipe.

**Drainage riser**: A waste pipe between the floor waste and the drainage system.

**Drinking water**: Water intended primarily for human consumption but which has other domestic uses.

**Explanatory Information**:
See also the Australian Drinking Water Guidelines produced by the National Health and Medical Research Council.

**Ductile failure**: Significant deformation of a member without loss of strength to resist design actions which, for the purposes of the Performance Requirements, may be taken to include (but not limited to) soil settlement and creep failure.

**TAS Early childhood centre**

**VIC Early childhood centre**

**Early childhood centre**: Any premises or part thereof providing or intending to provide a centre-based education and care service within the meaning of the Education and Care Services National Law Act 2010 (Vic), the Education and Care Services National Regulations and centre-based services that are licensed or approved under State and Territory children’s services law, but excludes education and care primarily provided to school aged children in outside school hours settings.

**Effective height**: The vertical distance between the floor of the lowest storey included in the calculation of rise in storeys and the floor of the topmost storey (excluding the topmost storey if it contains only heating, ventilating, lift or other equipment, water tanks or similar service units).

**Efficacy**: The degree to which a system achieves a design objective given that it performs to a level consistent with the system specification during the relevant fire scenario.

**Electricity network substation**: A building in which high voltage supply is converted or transformed and which is controlled by a licensed network service provider designated under a power of legislation.

**Electric passenger lift**: A power-operated lift for raising or lowering people in a car in which the motion of the car is obtained from an electric motor mechanically coupled to the hoisting mechanism.

**Electrohydraulic passenger lift**: A power-operated lift for raising or lowering people in a car in which the motion of the
car is obtained from the action of liquid under pressure acting on a piston or ram, the pressure being generated by a pump driven by an individual electric motor.

**Engaged pier:** A pier bonded to a masonry wall by course bonding of masonry units or by masonry ties.

(a) For the purposes of Section J in Volume One, the parts of a building’s fabric that separate a conditioned space or habitable room from—

(i) the exterior of the building; or

(ii) a non-conditioned space including—

(A) the floor of a rooftop plant room, lift-machine room or the like; and

(B) the floor above a carpark or warehouse; and

(C) the common wall with a carpark, warehouse or the like.

(b) For the purposes of Part H6 in Volume Two and Section 13 of the Housing Provisions, the parts of a building’s fabric that separate artificially heated or cooled spaces from—

(i) the exterior of the building; or

(ii) other spaces that are not artificially heated or cooled.

**Equivalent:** Equivalent to the level of health, safety and amenity provided by the Deemed-to-Satisfy Provisions.

**Evacuation route:** The continuous path of travel (including exits, public corridors and the like) from any part of a building, including within a sole-occupancy unit in a Class 2 or 3 building or Class 4 part, to a safe place.

**Evacuation time:** The time calculated from when the emergency starts for the occupants of the building to evacuate to a safe place.

(a) Any, or any combination of the following if they provide egress to a road or open space:

(i) An internal or external stairway.

(ii) A ramp.

(iii) A fire-isolated passageway.

(iv) A doorway opening to a road or open space.

(b) A horizontal exit or a fire-isolated passageway leading to a horizontal exit.

**TAS Expert Judgement**

**Expert Judgement:** The judgement of an expert who has the qualifications and experience to determine whether a Performance Solution or Deemed-to-Satisfy Solution complies with the Performance Requirements.

**Explanatory Information:**

Contemporary and relevant qualifications and/or experience are necessary to determine whether a Performance Solution complies with the Performance Requirements. The level of qualification and/or experience may differ depending on the complexity of the proposal and the requirements of the regulatory authority. Practitioners should seek advice from the authority having jurisdiction or appropriate authority for clarification as to what will be accepted.

**Exposed joint:** A construction joint, control joint, expansion joint, contraction joint or movement joint that is exposed to rainwater.

(a) For the purposes of Volume One, an outer wall of a building which is not a common wall.

(b) For the purposes of Volume Two, an outer wall of a building which is not a separating wall.

**Extra-low voltage:** A voltage not exceeding 50 V AC or 120 V ripple-free DC.

**Fabric:** The basic building structural elements and components of a building including the roof, ceilings, walls, glazing and floors.

**SA Farm building**

**Farm building:** A Class 7 or 8 building located on land primarily used for farming—

(a) that is—

(i) used in connection with farming; or

(ii) used primarily to store one or more farm vehicles; or
(iii) a combination of (i) and (ii); and
(b) in which the total number of persons accommodated at any time does not exceed one person per 200 m² of floor area or part thereof, up to a maximum of 8 persons; and
(c) with a total floor area of not more than 3500 m².

Farming: Includes—
(a) cultivating, propagating and harvesting plants or fungi or their products or parts, including seeds, spores, bulbs or the like, but does not include forestry; or
(b) maintaining animals in any physical environment for the purposes of—
(i) breeding them; or
(ii) selling them; or
(iii) acquiring and selling their bodily produce such as milk, wool, eggs or the like; or
(c) a combination of (a) and (b),
but does not include forestry or maintaining animals for sport or recreational purposes.

Farm shed: A single storey Class 7 or 8 building located on land primarily used for farming—
(a) that is—
(i) used in connection with farming; or
(ii) used primarily to store one or more farm vehicles; or
(iii) a combination of (i) and (ii); and
(b) occupied neither frequently nor for extended periods by people; and
(c) in which the total number of persons accommodated at any time does not exceed 2; and
(d) with a total floor area of more than 500 m² but not more than 2000 m².

Farm vehicle: A vehicle used in connection with farming.

Fatigue failure: Fracture of a material through progressive brittle cracking under repeated alternating or cyclic stresses of an intensity considerably less than strength under static load.

Finished ground level: For the purposes of H1D4 and H2D3 in Volume Two and Section 4 of the Housing Provisions, means the ground level adjacent to footing systems at the completion of construction and landscaping.

Fire actions: Each of the following—
(a) airborne embers; and
(b) burning debris and/or accumulated embers adjacent to building elements; and
(c) heat transfer from combustible materials within the site; and
(d) radiant heat from a bushfire front; and
(e) flame contact from a bushfire front.

Fire brigade: A statutory authority constituted under an Act of Parliament having as one of its functions, the protection of life and property from fire and other emergencies.

Fire brigade station: For the purposes of E1D2(1)(b) and I3D9, means a state or territory government operated premises which is a station for a fire brigade.

Fire compartment: Either—
(a) the total space of a building; or
(b) when referred to in—
(i) the Performance Requirements — any part of a building separated from the remainder by barriers to fire such as walls and/or floors having an appropriate resistance to the spread of fire with any openings adequately protected; or
(ii) the Deemed-to-Satisfy Provisions — any part of a building separated from the remainder by walls and/or floors each having an FRL not less than that required for a fire wall for that type of construction and where all openings in the separating construction are protected in accordance with the Deemed-to-Satisfy Provisions of the relevant Part.
Fire growth: The stage of fire development during which the heat release rate and the temperature of the fire are generally increasing.

Fire hazard: The danger in terms of potential harm and degree of exposure arising from the start and spread of fire and the smoke and gases that are thereby generated.

Fire hazard properties: The following properties of a material or assembly that indicate how they behave under specific fire test conditions:

(a) Average specific extinction area, critical radiant flux and Flammability Index, determined as defined in Schedule 2.

(b) Smoke-Developed Index, smoke development rate and Spread-of-Flame Index, determined in accordance with Specification 3.

(c) Group number and smoke growth rate index ($SMOGRA_{RC}$), determined in accordance with Specification 7.

Fire intensity: The rate of release of calorific energy in watts, determined either theoretically or empirically, as applicable.

Fire-isolated passageway: A corridor, hallway or the like, of fire-resisting construction, which provides egress to or from a fire-isolated stairway or fire-isolated ramp or to a road or open space.

Fire-isolated ramp: A ramp within a fire-resisting enclosure which provides egress from a storey.

Fire-isolated stairway: A stairway within a fire-resisting shaft and includes the floor and roof or top enclosing structure.

(a) The sum of the net calorific values of the combustible contents which can reasonably be expected to burn within a fire compartment, including furnishings, built-in and removable materials, and building elements.

(b) For the purposes of (1), the calorific values must be determined at the ambient moisture content or humidity (the unit of measurement is MJ).

Fire-protective covering: Any one or more of the following:

(a) 13 mm fire-protective grade plasterboard.

(b) 12 mm cellulose cement flat sheeting complying with AS/NZS 2908.2 or ISO 8336.

(c) 12 mm fibrous plaster reinforced with 13 mm x 13 mm x 0.7 mm galvanised steel wire mesh located not more than 6 mm from the exposed face.

(d) Other material not less fire-protective than 13 mm fire-protective grade plasterboard, fixed in accordance with the normal trade practice for a fire-protective covering.

Fire-resistance level (FRL): The grading periods in minutes determined in accordance with Specifications 1 and 2, for the following criteria—

(a) structural adequacy; and

(b) integrity; and

(c) insulation,

and expressed in that order.

Notes:

A dash means there is no requirement for that criterion. For example, 90/–/– means there is no requirement for an FRL for integrity and insulation, and –/–/– means there is no requirement for an FRL.

Fire-resisting construction: For the purposes of Volume One, means one of the Types of construction referred to in Part C2 of Volume One.

(a) For the purposes of Volume One, applied to a building element, having an FRL appropriate for that element.

(b) For the purposes of Volume Two, applied to a structural member or other part of a building, having the FRL required for that structural member or other part.

Fire safety engineering: Application of engineering principles, rules and expert judgement based on a scientific appreciation of the fire phenomenon, often using specific design scenario, of the effects of fire and of the reaction and behaviour of people in order to—

(a) save life, protect property and preserve the environment and heritage from destructive fire; and

(b) quantify the hazards and risk of fire and its effects; and
(c) mitigate fire damage by proper design, construction, arrangement and use of buildings, materials, structures, industrial processes and transportation systems; and
(d) evaluate analytically the optimum protective and preventive measures, including design, installation and maintenance of active and passive fire and life safety systems, necessary to limit, within prescribed levels, the consequences of fire.

**Fire safety system:** One or any combination of the methods used in a building to—
(a) warn people of an emergency; or
(b) provide for safe evacuation; or
(c) restrict the spread of fire; or
(d) extinguish a fire,
and includes both active and passive systems.

**Fire-source feature:** Any one or more of the following:
(a) The far boundary of a road, river, lake or the like adjoining the allotment.
(b) A side or rear boundary of the allotment.
(c) An *external wall* of another building on the allotment which is not a Class 10 building.

**Fire wall:** A wall with an appropriate resistance to the spread of fire that divides a *storey* or building into *fire compartments*.

**Fixed wired:** For the purposes of Specification 23, a system of electrical wiring (either AC or DC), in which cables are fixed or supported in position.

**Flammability Index:** The index number as determined by AS 1530.2.

**Flashing:** A strip or sleeve of impervious material dressed, fitted or built-in to provide a barrier to moisture movement, or to divert the travel of moisture, or to cover a joint where water would otherwise penetrate to the interior of a building.
(a) *Perimeter flashing:* A *flashing* used at the floor-wall junction.
(b) *Vertical flashing:* A *flashing* used at wall junctions within *shower areas*.

**Flashover:** In relation to *fire hazard properties*, means a heat release rate of 1 MW.

**Flight:** That part of a stair that has a continuous series of *risers*, including *risers of winders*, not interrupted by a *landing* or floor.

**Explanatory Information:**
A flight is the part of a stair that has a continuous slope created by the nosing line of treads. The length of a flight is limited to restrict the distance a person could fall down a stair.

Quarter *landings*, as shown in *Explanatory Figure 1*, are considered sufficient to halt a person’s fall and therefore are considered for the purposes of Volume Two and the ABCB Housing Provisions not to be part of the flight.
**Flood hazard area**

The *site* (whether or not mapped) encompassing land lower than the *flood hazard level* which has been determined by the *appropriate authority*.

**Flood hazard level (FHL):** The flood level used to determine the height of floors in a building and represents the *defined flood level* plus the *freeboard* (see Figure 3).

(a) For the purposes of Volume One—

(i) in relation to a building — the total area of all *storeys*; and

(ii) in relation to a *storey* — the area of all floors of that *storey* measured over the enclosing walls, and includes—

(A) the area of a *mezzanine* within the *storey*, measured within the finished surfaces of any *external walls*; and

(B) the area occupied by any *internal wall* or partitions, any cupboard, or other built-in furniture, fixture or fitting; and

(C) if there is no enclosing wall, an area which has a use that contributes to the *fire load* or impacts on the safety, health or amenity of the occupants in relation to the provisions of the BCA; and

(iii) in relation to a room — the area of the room measured within the *internal* finished surfaces of the walls, and includes the area occupied by any cupboard or other built-in furniture, fixture or fitting; and

(iv) in relation to a *fire compartment* — the total area of all floors within the *fire compartment* measured within the finished *internal* surfaces of the bounding construction, and if there is no bounding construction, includes an area which has a use which contributes to the *fire load*; and

(v) in relation to an *atrium* — the total area of all floors within the *atrium* measured within the finished surfaces of the bounding construction and if no bounding construction, within the *external walls*. 
For the purposes of Volume Two and the ABCB Housing Provisions, in relation to a room, the area of the room measured within the finished surfaces of the walls, and includes the area occupied by any cupboard or other built-in furniture, fixture or fitting (see Figure 4).

**Figure 4:** Identification of floor area of a room

![Figure 4](image)

_Floor waste:_ A grated inlet within a graded floor intended to drain the floor surface.

_Foundation:_ The ground which supports the building (see Figure 5).

**Figure 5:** Identification of foundation

![Figure 5](image)

**Fractional effective dose (FED):** The fraction of the dose (of thermal effects) that would render a person of average susceptibility incapable of escape.

**Explanatory Information:**

The definition for FED has been modified from the ISO definition to be made specific for the Fire Safety Verification Method. The use of CO or CO₂ as part of FED is not part of that Verification Method. This is because the ability to measure CO in a repeatable test varies by two orders of magnitude for common cellulosic fuel.

**VIC Freeboard**

_Freeboard:_ The height above the defined flood level as determined by the appropriate authority, used to compensate for effects such as wave action and localised hydraulic behaviour.

**Fully developed fire:** The state of total involvement of the majority of available combustible materials in a fire.

(a) For the purposes of Section J, a transparent or translucent element and its supporting frame located in the envelope, and includes a window other than a roof light.

(b) For the purposes of Part H6 and Section 13 of the Housing Provisions—

(i) a transparent or translucent element and its supporting frame located in the external fabric of the building; and

(ii) includes a window other than a roof light.

_Going:_ The horizontal dimension from the front to the back of a tread less any overhang from the next tread or landing above (see Figure 11.2.2f in the Housing Provisions).
Gradual failure: Relatively slow collapse of a structure that occurs through significant plastic deformation and/or moment redistribution.

Green Star: The building sustainability rating scheme managed by the Green Building Council of Australia.

Group number: The number of one of 4 groups of materials used in the regulation of fire hazard properties and applied to materials used as a finish, surface, lining, or attachment to a wall or ceiling.

Habitable room: A room used for normal domestic activities, and—
(a) includes a bedroom, living room, lounge room, music room, television room, kitchen, dining room, sewing room, study, playroom, family room, home theatre and sunroom; but
(b) excludes a bathroom, laundry, water closet, pantry, walk-in wardrobe, corridor, hallway, lobby, photographic darkroom, clothes-drying room, and other spaces of a specialised nature occupied neither frequently nor for extended periods.

Hazard Rating: A level of potential toxicity that may cause contamination in a drinking water system, having a Thee Ate of either Low Hazard, Medium Hazard or High Hazard, is determined in accordance with NCC Volume Three, Specification 41, for any Deemed-to-Satisfy Solution.

Health-care building: A building whose occupants or patients undergoing medical treatment generally need physical assistance to evacuate the building during an emergency and includes—
(a) a public or private hospital; or
(b) a nursing home or similar facility for sick or disabled persons needing full-time care; or
(c) a clinic, day surgery or procedure unit where the effects of the predominant treatment administered involve patients becoming non-ambulatory and requiring supervised medical care on the premises for some time after the treatment.

Heated water: Water that has been intentionally heated; normally referred to as hot water or warm water.

Heating load: The calculated amount of energy delivered to the heated spaces of the building annually by artificial means to maintain the desired temperatures in those spaces.

Heat release: The thermal energy produced by combustion (measured in kJ).

Heat release rate (HRR): The rate of thermal energy production generated by combustion, measured in kW (preferred) or MW.

High Hazard: Any condition, device or practice which, in connection with a water supply, has the potential to cause death.

High wind area: A region that is subject to design wind speed more than N3 or C1 (see Table 3).

Hob: The upstand at the perimeter to a shower area.

Horizontal exit: A required doorway between 2 parts of a building separated from each other by a fire wall.

Hours of operation: The number of hours when the occupancy of the building is greater than 20% of the peak occupancy.
(a) For the purposes of Volume One, means software accredited under the Nationwide House Energy Rating Scheme.
(b) For the purposes of Volume Two—
(i) applied to H6V2—software accredited or previously accredited under the Nationwide House Energy Rating Scheme and the additional functionality provided in non-regulatory mode; and
(ii) applied to H6D3—software accredited under the Nationwide House Energy Rating Scheme.

Explanatory Information:
The Nationwide House Energy Rating Scheme (NatHERS) refers to the Australian Governments’ scheme that facilitates consistent energy ratings from software tools which are used to assess the potential thermal efficiency of dwelling envelopes.

Housing Provisions: The requirements for Class 1 and 10 buildings referenced in Volume Two of the National Construction Code, as published by the Australian Building Codes Board.

Illuminance: The luminous flux falling onto a unit area of surface.

Illumination power density: The total of the power that will be consumed by the lights in a space, including any lamps, ballasts, current regulators and control devices other than those that are plugged into socket outlets for intermittent use such as floor standing lamps, desk lamps or work station lamps, divided by the area of the space, and expressed
in W/m².

**Explanatory Information:**

Illumination power density relates to the power consumed by the lighting system and includes the light source or luminaire and any control device. The power for the lighting system is the illumination power load. This approach is more complicated than the lamp power density approach but provides more flexibility for a dwelling with sophisticated control systems.

The area of the space refers to the area the lights serve. This could be considered a single room, open plan space, verandah, balcony or the like, or the total area of all these spaces.

**Importance Level:** A number which ranks the relative importance of structures and buildings (shown in Table 3) based on the potential risk to life resulting from their scale and/or use.

**Table 3: Importance Levels for building types**

<table>
<thead>
<tr>
<th>Importance Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Structures presenting a low degree of hazard to life and other property</td>
</tr>
<tr>
<td>2</td>
<td>Normal structures and structures not in other Importance Levels</td>
</tr>
<tr>
<td>3</td>
<td>Structures that as a whole may contain people in crowds or contents of high value to the community or pose risks to people in crowds</td>
</tr>
<tr>
<td>4</td>
<td>Structures with special post-disaster functions</td>
</tr>
<tr>
<td>5</td>
<td>Special structures</td>
</tr>
</tbody>
</table>

**Explanatory Information:**

Examples of Importance Levels of certain buildings, structures and facilities

(a) **Importance Level 1**, include but not limited to:
   (i) Structures with a total floor area < 30 m².
   (ii) Farm buildings, isolated structures, towers in rural situations.

(b) **Importance Level 2**, include but not limited to:
   (i) Buildings not included in Importance Level 1, 3 or 4.
   (ii) Single family dwellings.

(c) **Importance Level 3**, include but not limited to:
   (i) Where more than 300 people can congregate in one area.
   (ii) Day care facilities with a capacity greater than 150.
   (iii) Primary school or secondary school facilities with a capacity greater than 250.
   (iv) Colleges or adult education facilities with a capacity greater than 500.
   (v) Health care facilities with a capacity of 50 or more residents.
   (vi) Airport terminals, principal railway stations with a capacity greater than 250.
   (vii) Correctional institutions.
   (viii) Multi-occupancy residential, commercial (including shops), industrial, office and retailing buildings designed to accommodate more than 5000 people and with a gross area greater than 10,000 m².
   (ix) Public assembly buildings, theatres and cinemas of greater than 1,000 m².
   (x) Emergency medical and other emergency facilities not designated as post-disaster.
   (xi) Power-generating facilities, water treatment and waste-water treatment facilities and other public utilities not designated as post-disaster.
   (xii) Buildings and facilities not designated as post-disaster containing hazardous materials capable of causing hazardous conditions that do not extend beyond the property boundaries.

(d) **Importance Level 4**, include but not limited to:
(i) Buildings and facilities designated as essential facilities buildings and facilities with special post-disaster functions medical emergency or surgical facilities.

(ii) Emergency service facilities such as fire, police stations and emergency vehicle garages.

(iii) Utilities or emergency supplies or installations required as backup for buildings and facilities of Importance Level 4.

(iv) Designated emergency shelters, designated emergency centres and ancillary facilities.

(v) Buildings and facilities containing hazardous materials capable of causing hazardous conditions that extend beyond the property boundaries.

(e) Importance Level 5, include but not limited to:

(i) Structures that have special functions or whose failure poses catastrophic risk to a large area (e.g. 100 km²) or a large number of people (e.g. 100,000).

(ii) Major dams, extreme hazard facilities.

Inclined lift: A power-operated device for raising or lowering people within a carriage that has one or more rigid guides on an inclined plane.

Individual protection: The installation of a backflow prevention device at the point where a water service connects to a single fixture or appliance.

Individual risk: The frequency at which an individual may be expected to sustain a given level of harm from the realisation of a specified hazard.

Insulation: In relation to an FRL, the ability to maintain a temperature on the surface not exposed to the furnace below the limits specified in AS 1530.4.

Integrity: In relation to an FRL, the ability to resist the passage of flames and hot gases specified in AS 1530.4.

(a) For the purposes of Volume One, excludes a common wall or a party wall.

(b) For the purposes of Volume Two, excludes a separating wall, common wall or party wall.

Interstitial condensation: The condensation of moisture on surfaces between material layers inside the building component.

Irrigation system: An irrigation system of the following types:

(a) Type A— all permanently open outlets and piping more than 150mm above finished ground level, not subject to ponding or back-pressure and not involving injection systems.

(b) Type B— irrigation systems in domestic or residential buildings with piping or outlets installed less than 150mm above finished surface level and not involving injection systems.

(c) Type C— irrigation systems in other than domestic or residential buildings with piping outlets less than 150mm above finished surface level and not involving injection systems.

(d) Type D— irrigation systems where fertilizers, herbicides, nemacides or the like are injected or siphoned into the system.

JAS-ANZ: The Joint Accreditation System of Australia and New Zealand.

Lamp power density: The total of the maximum power rating of the lamps in a space, other than those that are plugged into socket outlets for intermittent use such as floor standing lamps, desk lamps or work station lamps, divided by the area of the space, and expressed in W/m².

Explanatory Information:
Lamp power density is a simple means of setting energy consumption at an efficient level for Class 1 and associated Class 10a buildings.

Lamp refers to the globe or globes that are to be installed in a permanently wired light fitting. The maximum power of a lamp is usually marked on the fitting as the maximum allowable wattage.

The area of the space refers to the area the lights serve. This could be considered a single room, open plan space, verandah, balcony or the like, or the total area of all these spaces.

Landing: An area at the top or bottom of a flight or between two flights.

Latent heat gain: The heat gained by the vapourising of liquid without change of temperature.
**Lateral support**: A support (including footing, buttress, cross wall, beam, floor or braced roof structure) that effectively restrains the wall or pier at right angles to the face of the wall or pier.

**Lightweight construction**: Construction which incorporates or comprises—
(a) sheet or board material, plaster, render, sprayed application, or other material similarly susceptible to damage by impact, pressure or abrasion; or
(b) concrete and concrete products containing pumice, perlite, vermiculite, or other soft material similarly susceptible to damage by impact, pressure or abrasion; or
(c) masonry having a width of less than 70 mm.

**Loadbearing**: Intended to resist vertical forces additional to those due to its own weight.

**Loadbearing wall**: For the purposes of H1D4, H2D3 and Section 4 of the Housing Provisions, means any wall imposing on the footing a load greater than 10 kN/m.

**Loss**: Physical damage, financial loss or loss of amenity.

**Low Hazard**: Any condition, device or practice which, in connection with a water supply, would constitute a nuisance by colour, odour or taste but does not have the potential to injure or endanger health.

**Low lead**: Where a plumbing product or material in contact with drinking water is calculated using a weighted average lead content of no more than 0.25%.

**Low rainfall intensity area**: An area with a 5 minute rainfall intensity for an annual exceedance probability of 5% average recurrence interval of 20 years of not more than 125 mm/hour.

**Explanatory Information**: Rainfall intensity figures can be obtained from Tables 7.4.3d to 7.4.3k in the Housing Provisions.

**Low-rise, low-speed constant pressure lift**: A power-operated low-rise, low-speed device for raising or lowering people with limited mobility on a carriage that is controlled by the application of constant pressure to a control.

**Low-rise platform lift**: A power-operated device for raising or lowering people with limited mobility on a platform, that is controlled automatically or by the application of constant pressure to a control.

**Low voltage**: A voltage exceeding extra-low voltage, but not exceeding 1000 V AC or 1500 V DC.

**Luminance contrast**: The light reflected from one surface or component, compared to the light reflected from another surface or component.

**Massive timber**: An element not less than 75 mm thick as measured in each direction formed from solid and laminated timber.

**Maximum acceptable annual probability of structural failure of structures, buildings, members and connections**: The probability that, in any year, there could be a structural failure leading to collapse of either the whole of the structure or building, or significant members and/or their connections, expressed as 1 in … (e.g. 1 in 1,000 meaning a probability of 1 in 1,000 that the failure could occur).

**Maximum retained water level**: The point where surface water will start to overflow out of the shower area.

**Medium Hazard**: Any condition, device or practice which, in connection with a water supply, has the potential to injure or endanger health.

**Members**: The parts of a structure or component that provide resistance to structural actions.

**Members and connections that do not provide primary building support**: Those components of a building or other structure that are not necessary to resist collapse of other members, parts of the building or the whole building, including but are not limited to—
(a) non-loadbearing walls including framing, wall cladding, roof cladding, roof purlins and battens, mezzanine floors; and
(b) connections and fixings that fix in position only those members that do not provide primary building support.

**Members and connections that provide primary building support**: Those components of a building or other structure that provide the structural system resisting collapse of other members, parts of the building or the whole building under the design actions, including but are not limited to—
(a) beams, columns, trusses, portal frames, posts, loadbearing walls, floor systems, footings, foundations and earth retaining structures; and
(b) connections and fixings that transfer loads between members that provide primary building support.

Membrane: A barrier impervious to moisture.

Explanatory Information:
A barrier may be a single or multi-part system.

Mezzanine: An intermediate floor within a room.

Minimum Acceptable Annual Structural Reliability Index of Structures, Buildings, Members and Connections: The Structural Reliability Index (β), determined in accordance with the ABCB Structural Reliability Handbook (Version 2022.1) that corresponds to the maximum acceptable annual probability of structural failure tabulated in Table B1P1.

Mixed construction: A building consisting of more than one form of construction, particularly in double-storey buildings.

Mould: A fungal growth that can be produced from conditions such as dampness, darkness, or poor ventilation.

Multiple resistance paths: Situations where the failure of a part of a building or structure is resisted collectively by more than one member or connection, such that the failure of any member or connection will result in the transfer of loads to the other members and connections with sufficient combined capacity to resist the total applied loads.

NABERS Energy for Apartment Buildings: The National Australian Built Environment Rating System for apartment building energy efficiency, which is managed by the New South Wales Government.

NABERS Energy for Hotels: The National Australian Built Environment Rating System for hotel building energy efficiency, which is managed by the New South Wales Government.

NABERS Energy for Offices: The National Australian Built Environment Rating Systems for office energy efficiency, which is managed by the New South Wales Government.

NABERS Energy for Shopping Centres: The National Australian Built Environment Rating System for shopping centre energy efficiency, which is managed by the New South Wales Government.

TAS Network Utility Operator

Network Utility Operator: A person who—

(a) undertakes the piped distribution of drinking water or non-drinking water for supply; or

(b) is the operator of a sewerage system or a stormwater drainage system.

Explanatory Information:
A Network Utility Operator in most States and Territories is the water and sewerage authority licensed to supply water and receive sewage and/or stormwater. The authority operates or proposes to operate a network that undertakes the distribution of water for supply and undertakes to receive sewage and/or stormwater drainage. This authority may be a licensed utility, local government body or council.

(a) Applied to a material — means not deemed combustible as determined by AS 1530.1 — Combustibility Tests for Materials.

(b) Applied to construction or part of a building — means constructed wholly of materials that are not deemed combustible.

Non-drinking water: Water which is not intended primarily for human consumption, but which may have other uses, drinking water.

Non-transient actions: The combination of structural actions in which the combined magnitude of the permanent gravity action and imposed gravity action is equal to or greater than 50% of the magnitude of the total combined actions.

(a) For the purposes of Volume One, the features, needs and profile of the occupants in a habitable room or space.

(b) For the purposes of Volume Two, the features, needs and profile of the occupants in a room or space.

Explanatory Information:
For the purpose of Volume Two, this term is used to describe the characteristics of the occupants and their associated requirements in relation to a room or space.
For example, in relation to a bedroom, the following occupant characteristics and associated requirements should be considered:

- Characteristics: height, mobility and how often the space will be used.
- Requirements: a sleeping space and a space to undertake leisure activities.

**Occupiable outdoor area:** A space on a roof, balcony or similar part of a building—

- that is open to the sky; and
- to which access is provided, other than access only for maintenance; and
- that is not open space or directly connected with open space.

**TAS On-site wastewater management system**

**On-site wastewater management system:** A system installed on premises that receives and/or treats wastewater generated and discharges on the premises and applies the resulting effluent to an approved disposal system or reuse system.

**Open-deck carpark:** A carpark in which all parts of the parking storeys are cross-ventilated by permanent unobstructed openings in not fewer than 2 opposite or approximately opposite sides, and—

- each side that provides ventilation is not less than $\frac{1}{6}$ of the area of any other side; and
- the openings are not less than $\frac{1}{2}$ of the wall area of the side concerned.

**Open space:** A space on the allotment, or a roof or similar part of a building adequately protected from fire, open to the sky and connected directly with a public road.

**Open spectator stand:** A tiered stand substantially open at the front.

**Other property:** All or any of the following—

- any building on the same or an adjoining allotment; and
- any adjoining allotment; and
- a road.

**Outdoor air:** Air outside the building.

**Outdoor air economy cycle:** A mode of operation of an air-conditioning system that, when the outdoor air thermodynamic properties are favourable, increases the quantity of outdoor air used to condition the space.

**Outfall:** That part of the disposal system receiving surface water from the drainage system and may include a natural water course, kerb and channel, or soakage system.

**Overflow devices:** A device that provides relief to a water service, sanitary plumbing and drainage system, rainwater service, harvesting system or stormwater system to avoid the likelihood of uncontrolled discharge.

**Panel wall:** A non-loadbearing external wall, in frame or similar construction, that is wholly supported at each storey.

**Partially buried rainwater tank:** A rainwater tank that is not completely covered by earth but is partially set into the ground.

**Patient care area:** A part of a health-care building normally used for the treatment, care, accommodation, recreation, dining and holding of patients including a ward area and treatment area.

**Performance-based design brief (PBDB):** The process and the associated report that defines the scope of work for the performance-based analysis, the technical basis for analysis, and the criteria for acceptance of any relevant Performance Solution as agreed by stakeholders.

**Performance Requirement:** A requirement which states the level of performance which a Performance Solution or Deemed-to-Satisfy Solution must meet.

**Performance Solution:** A method of complying with the Performance Requirements other than by a Deemed-to-Satisfy Solution.

**Perimeter of building:** For the purposes of Section 8 of the Housing Provisions, means the external envelope of a building.

**Personal care services:** Any of the following:

- The provision of nursing care.
- Assistance or supervision in—
  - bathing, showering or personal hygiene; or
Definitions

(ii) toileting or continence management; or
(iii) dressing or undressing; or
(iv) consuming food.

c) The provision of direct physical assistance to a person with mobility problems.

d) The management of medication.

e) The provision of substantial rehabilitative or development assistance.

Piping: For the purposes of Section J in Volume One or Part H6 in Volume Two, and Section 13 of the Housing Provisions, means an assembly of pipes, with or without valves or other fittings, connected together for the conveyance of liquids and gases.

Pliable building membrane: A water barrier as classified by AS/NZS 4200.1.

Plumbing: Any water service plumbing or roof plumbing, sanitary plumbing system or heating, ventilation and air-conditioning plumbing.

Plumbing or Drainage Solution: A solution which complies with the Performance Requirement and is a—
(a) Performance Solution; or
(b) Deemed-to-Satisfy Solution; or
(c) combination of (a) and (b).

Point of connection: Any of the following:
(a) For a heated water service means the point where the water heater connects to the cold water service downstream of the isolation valve.
(b) For sanitary plumbing means the point where the sanitary plumbing system connects to the sanitary drainage system.
(c) For sanitary drainage sewage disposal means the point where the on-site sanitary drainage drainage system connects to the Network Utility Operator’s sewerage system or to an on-site wastewater management system.
   (i) the Network Utility Operator’s sewerage system; or
   (ii) an on-site wastewater management system.
(d) For stormwater disposal means the point where the on-site stormwater drainage system connects to the Network Utility Operator’s stormwater system or to an approved disposal system.
   (i) the Network Utility Operator’s stormwater system; or
   (ii) an approved on-site disposal system.
(e) For a fire-fighting water service means the point where the service connects to—
   (i) a cold water service, downstream of a backflow prevention device; or
   (ii) the Network Utility Operator’s water supply system; or
   (iii) the point of isolation to an alternative water source.
(f) For a cold water service means the point where the cold water service connects to—pipe within the premises connects to the Network Utility Operator’s property service or to an alternative water supply system.
   (i) the Network Utility Operator’s water supply system; or
   (ii) the point of isolation to an alternative water source where there is no Network Utility Operator’s water supply available or is not utilised.
(g) For a rainwater service means the point where the rainwater service connects to the point of isolation to the rainwater storage.

Notes:
A domestic fire sprinkler service conforming to FPAA101D is considered part of the cold water service.

Explanatory Information:
The point of connection is usually determined by the Network Utility Operator according to the water and sewerage
Acts, Regulations and codes that apply within the Network Utility Operator’s licensed area and/or jurisdiction.

**Point of discharge:** The outlet of a—

(a) tap or outlet that discharges water over plumbing fixtures; or
(b) cistern inlet valve or flushing device of a sanitary fixture; or
(c) water service used for the connection of an appliance which is readily accessible and easily connected or disconnected; or
(d) tap, outlet or end of line valve where water is discharged to the atmosphere under normal operating conditions; or
(e) isolating valve or the outlet provided for the connection of industrial or specialist equipment to the water service; or
(f) backflow prevention device connected to a fire service or irrigation system; or
(g) relief drain line or vent pipe from a water heater, temperature and pressure relief valve or expansion control valve.

**Explanatory Information:**

The point of discharge of a tap or fixture commonly includes the outlets of a basin or bath taps, shower heads, drinking fountains, flush valves or cistern inlet valves.

The point of discharge of a water service used for the connection of an appliance commonly includes outlets of an isolation valve provided for the connection of dishwashers, clothes washers, coffee machines and fridges with beverage dispensing and ice making capabilities.

The point of discharge for a tap discharging to atmosphere may include hose cocks. It does not include any subsequent connections to this outlet such as garden hoses.

Contamination control may be required to avoid contamination of the water service where a hazard exists beyond the point of discharge.

Water services downstream of the backflow prevention device are considered an unprotected water service.

**Predicted Mean Vote (PMV):** The Predicted Mean Vote of the thermal perception of building occupants determined in accordance with ANSI/ASHRAE Standard 55.

**Preformed shower base:** A preformed, prefinished vessel installed as the finished floor of a shower compartment, and which is provided with a connection point to a sanitary drainage system.

**Explanatory Information:**

Shower bases are commonly made of plastics, composite materials, vitreous enamelled pressed steel, or stainless steel.

**Pressure vessel:** A vessel subject to internal or external pressure, including interconnected parts and components, valves, gauges and other fittings up to the first point of connection to connecting piping, and—

(a) includes fire heaters and gas cylinders; but

(b) excludes—

(i) any vessel that falls within the definition of a boiler; and

(ii) storage tanks and equipment tanks intended for storing liquids where the pressure at the top of the tank is not exceeding 1.4 kPa above or 0.06 kPa below atmospheric pressure; and

(iii) domestic-type hot water supply heaters and tanks; and

(iv) pressure vessels installed for the purposes of fire suppression or which serve a fire suppression system.

**QLD Primary building element**

(a) For the purposes of Volume One, a member of a building designed specifically to take part of the loads specified in B1D3 and includes roof, ceiling, floor, stairway or ramp and wall framing members including bracing members designed for the specific purpose of acting as a brace to those members.

(b) For the purposes of Part 3.4 of the Housing Provisions, means a member of a building designed specifically to
take part of the building loads and includes roof, ceiling, floor, stairway or ramp and wall framing members including bracing members designed for the specific purpose of acting as a brace to those members.

**Explanatory Information:**
The loads to which a building may be subjected are dead, live, wind, snow and earthquake loads. Further information on building loads can be found in the AS 1170 series of Standards.

**Private bushfire shelter:** A structure associated with, but not attached to, or part of a Class 1a dwelling that may, as a last resort, provide shelter for occupants from immediate life threatening effects of a bushfire.

(a) For the purposes of Volume One—
   (i) any garage associated with a Class 1 building; or
   (ii) any single *storey* of a building of another Class containing not more than 3 vehicle spaces, if there is only one such *storey* in the building; or
   (iii) any separate single *storey* garage associated with another building where such garage contains not more than 3 vehicle spaces.

(b) For the purposes of Volume Two—
   (i) any garage associated with a Class 1 building; or
   (ii) any separate single *storey* garage associated with another building where such garage contains not more than 3 vehicle spaces.

**Product:** *Plumbing* and *drainage* items within the scope of Volume Three including but not limited to—

(a) materials, fixtures and components used in a *plumbing* or *drainage* installation; and

(b) appliances and equipment connected to a *plumbing* or *drainage* system.

**Product Technical Statement:** A form of documentary evidence stating that the properties and performance of a building material, product or form of construction fulfil specific requirements of the NCC, and describes—

(a) the application and intended use of the building material, product or form of construction: and

(b) how the use of the building material, product or form of construction complies with the requirements of the NCC Volume One and Volume Two; and

(c) any limitations and conditions of the use of the building material, product or form of construction relevant to (b).

**TAS Professional engineer**

**Professional engineer:** A person who is—

(a) if legislation is applicable — a registered professional engineer in the relevant discipline who has appropriate experience and competence in the relevant field; or

(b) if legislation is not applicable—
   (i) registered in the relevant discipline on the National Engineering Register (NER) of the Institution of Engineers Australia (which trades as ‘Engineers Australia’); or
   (ii) eligible to become registered on the Institution of Engineers Australia’s NER and has appropriate experience and competence in the relevant field.

**Public corridor:** An enclosed corridor, hallway or the like which—

(a) serves as a means of egress from 2 or more *sole-occupancy units* to a *required exit* from the *storey* concerned; or

(b) is *required* to be provided as a means of egress from any part of a *storey* to a *required exit*.

**Rainwater service harvesting system:** A water service which distributes water from the isolation valve of the rainwater storage to the rainwater points of discharge for purposes such as for clothes washing, urinal and water closet flushing and external hose cocks. A plumbing installation that comprises—

A plumbing installation that comprises—

(a) any plumbing that connects a rainwater tank to any drinking water or non-drinking water outlet; and

(b) any top-up line that conveys drinking water from a Network Utility Operator’s water supply to a rainwater tank.

**Rainwater storage:** Any storage of rainwater collected from a roof catchment area which is used to supply water for the
primary purposes of drinking, personal hygiene or other uses.

Notes:
Generally this applies to water which is not supplied by a Network Utility Operator. This does not include rainwater storage for non-drinking purposes.

Rapid roller door: A door that opens and closes at a speed of not less than 0.5 m/s.

TAS Recognised expert

Recognised expert: A person with qualifications and experience in the area of plumbing or drainage in question recognised by the authority having jurisdiction.

Explanatory Information:
A recognised expert is a person recognised by the authority having jurisdiction as qualified to provide evidence under A5G4(5). Generally, this means a hydraulic consultant or engineer, however the specific requirements are determined by the authority having jurisdiction.

Under A5G4(5), a report from a recognised expert may be used as evidence of suitability that a product listed on the WaterMark Schedule of Excluded Products, or a plumbing or drainage system, complies with a Performance Requirement or Deemed-to-Satisfy Provisions.

Explanatory Information:
For Volume One, a hypothetical building that is used to calculate the maximum allowable annual greenhouse gas emissions and determine the thermal comfort level for the proposed building.

For the purposes of Volume Two, means a hypothetical building that is used to determine the maximum allowable heating load and cooling load for the proposed building.

Reflective insulation: A building membrane with a reflective surface such as a reflective foil laminate, reflective barrier, foil batt or the like capable of reducing radiant heat flow.

Explanatory Information:
For Volume Two:
(a) Typical R-Value achieved by adding reflective insulation are given in the explanatory information accompanying Section 13 of the Housing Provisions. Information on specific products may be obtained from reflective insulation manufacturers.

(b) The surface of reflective insulation may be described in terms of its emittance (or infra-red emittance) or in terms of its reflectance (or solar reflectance). Generally, for the surface of a particular reflective insulation –
(c) emittance + reflectance = 1.
(d) Some types of reflective insulation may also serve the purposes of waterproofing or vapour proofing.

Regulated energy: The energy consumed by a building’s services minus the amount of renewable energy generated and used on site.

Reinforced masonry: Masonry reinforced with steel reinforcement that is placed in a bed joint or grouted into a core to strengthen the masonry.

Reliability: The probability that a system performs to a level consistent with the system specification.

Renewable energy: Energy that is derived from sources that are regenerated, replenished, or for all practical purposes cannot be depleted and the energy sources include, but are not limited to, solar, wind, hydroelectric, wave action and geothermal.

Reportable fire: A fire that would be reported to the fire brigade.

Required: Required to satisfy a Performance Requirement or a Deemed-to-Satisfy Provision of the NCC as appropriate.

Required safe egress time (RSET): The time required for safe evacuation of occupants to a place of safety prior to the onset of untenable conditions.

Residential aged care building: A Class 3 or 9a building whose residents, due to their incapacity associated with the ageing process, are provided with physical assistance in conducting their daily activities and to evacuate the building during an emergency.
Residential care building: A Class 3, 9a or 9c building which is a place of residence where 10% or more of persons who reside there need physical assistance in conducting their daily activities and to evacuate the building during an emergency (including any aged care building or residential aged care building) but does not include a hospital.

Resident use area: Part of a Class 9c building normally used by residents, and—
(a) includes sole-occupancy units, lounges, dining areas, activity rooms and the like; but
(b) excludes offices, storage areas, commercial kitchens, commercial laundries and other spaces not for the use of residents.

Resistance to the incipient spread of fire: In relation to a ceiling membrane, means the ability of the membrane to insulate the space between the ceiling and roof, or ceiling and floor above, so as to limit the temperature rise of materials in this space to a level which will not permit the rapid and general spread of fire throughout the space.

Explanatory Information:
Resistance to the incipient spread of fire refers to the ability of a ceiling to prevent the spread of fire and thermally insulate the space between the ceiling and the roof or floor above. “Resistance to the incipient spread of fire” is superior to “fire-resistance” because it requires a higher standard of heat insulation.

The definition is used in Volume Two for separating floors/ceilings for a Class 1a dwelling located above a non-appurtenant private garage.

Rise in storeys: The greatest number of storeys calculated in accordance with C2D3 of Volume One.

Riser: The height between consecutive treads and between each landing and continuous tread.

Rolled fill: Material placed in layers and compacted by repeated rolling by an excavator.

Roof light: For the purposes of Section J and Part F4 in Volume One, Part H6 in Volume Two, and Part 10.5 and Section 13 of the Housing Provisions, a skylight, window or the like installed in a roof—
(a) to permit natural light to enter the room below; and
(b) at an angle between 0 and 70 degrees measured from the horizontal plane.

R-Value: The thermal resistance of a component calculated by dividing its thickness by its thermal conductivity, expressed in m².K/W.

Safe place: Either—
(a) a place of safety within a building—
(i) which is not under threat from a fire; and
(ii) from which people must be able to safely disperse after escaping the effects of an emergency to a road or open space; or
(b) a road or open space.

Sanitary compartment: A room or space containing a closet pan or urinal (see Figures 6a and 6b).
Figure 6a: Identification of a sanitary compartment (diagram a)
**Definitions**

**Sarking-type material:** A material such as a *reflective insulation* or other flexible membrane of a type normally used for a purpose such as waterproofing, vapour management or thermal reflectance.

**School:** Includes a primary or secondary school, college, university or similar educational establishment.

**Screed:** A layer of material (usually cement based) of defined minimum thickness which sets in situ between a structural base and the finished floor material.

**Self-closing:** Is defined—

(a) For the purposes of Volume One, applied to a door, means equipped with a device which returns the door to the fully closed position immediately after each opening.

(b) For the purposes of Volume Two, applied to a door or *window*, means equipped with a device which returns the door or *window* to the fully closed and latched position immediately after each manual opening.

**Self draining:** Materials, systems or ballast that—

(a) are above the structural substrate; and

(b) have sufficient gaps or openings to permit drainage of rainwater to a membrane on the structural substrate below.

**Sensible heat gain:** The heat gained which causes a change in temperature.

**Separating element:** A barrier that exhibits fire *integrity, structural adequacy, insulation*, or a combination of these for a period of time under specified conditions (often in accordance with AS 1530.4).

**Separating wall:** A wall that is common to adjoining Class 1 buildings (see Figure 7).
Definitions

Figure 7: Separating wall

Separating wall

Class 1 building
Class 1 building
Class 1 building

Elevation

Figure Notes:
In Volume Two a separating wall may also be known as a party wall and typically is required to be fire-resisting construction (see Housing Provisions Parts and ).

Service: For the purposes of Section J in Volume One, means a mechanical or electrical system that uses energy to provide air-conditioning, mechanical ventilation, heated water supply, artificial lighting, vertical transport and the like within a building, but which does not include—

(a) systems used solely for emergency purposes; and
(b) cooking facilities; and
(c) portable appliances.

Service station: A garage which is not a private garage and is for the servicing of vehicles, other than only washing, cleaning or polishing.

Shaft: The walls and other parts of a building bounding—

(a) a well, other than an atrium well; or
(b) a vertical chute, duct or similar passage, but not a chimney or flue.

Shower area: The area affected by water from a shower, including a shower over a bath.

(a) Enclosed — The area enclosed by walls or screens including hinged or sliding doors that control the spread of water to within the enclosure but excludes—
   (i) a shower fitted with a frameless or semi frameless shower screen, shower curtain or the like; and
   (ii) a shower fitted over a bath with a screen less than 1500 mm long.
(b) Unenclosed — The area where, under normal use, water out of the shower rose is not contained within 1500 mm of the shower rose.

Shower screen: The panels, doors or windows enclosing or partially enclosing a shower area.

Single leaf masonry: Outer walls constructed with a single thickness of masonry unit.

Single resistance paths: Situations where the failure of a part of a building or structure is resisted by only one member or connection, such that the failure of that member or connection will result in the collapse of a significant part of the building or structure.

Site: The part of the allotment of land on which a building stands or is to be erected.

Sitework: Work on or around a site, including earthworks, preparatory to or associated with the construction, alteration, demolition or removal of a building.

Small-sized, low-speed automatic lift: A restricted use power-operated device for the infrequent raising or lowering of people with limited mobility on a platform that is controlled automatically but has the capability of being electrically isolated by a key-lockable control.
Smoke-and-heat vent: A vent, located in or near the roof for smoke and hot gases to escape if there is a fire in the building.

Smoke-Developed Index: The index number for smoke as determined by AS/NZS 1530.3.

Smoke development rate: The development rate for smoke as determined by testing flooring materials in accordance with AS ISO 9239.1.

Smoke growth rate index ($\text{SMOGRA}_{\text{RC}}$): The index number for smoke used in the regulation of fire hazard properties and applied to materials used as a finish, surface, lining or attachment to a wall or ceiling.

Societal risk: Frequency and the number of people suffering from a specified level of harm in a given population from the realisation of specified hazards.

Solar admittance: The fraction of incident irradiance on a wall-glazing construction that adds heat to a building’s space.

Sole-occupancy unit: A room or other part of a building for occupation by one or joint owner, lessee, tenant, or other occupier to the exclusion of any other owner, lessee, tenant, or other occupier and includes—

(a) a dwelling; or
(b) a room or suite of rooms in a Class 3 building which includes sleeping facilities; or
(c) a room or suite of associated rooms in a Class 5, 6, 7, 8 or 9 building; or
(d) a room or suite of associated rooms in a Class 9c building, which includes sleeping facilities and any area for the exclusive use of a resident.

Spandrel panel: For the purposes of Section J, means the opaque part of a façade in curtain wall construction which is commonly adjacent to, and integrated with, glazing.

Specialist equipment: Equipment used within hospitality or health care industries which is installed by specialist technicians.

Notes:
Examples may include medical equipment, commercial chemical or beverage dispensers, dental chairs or similar specialist equipment.

Spiral stairway: A stairway with a circular plan, winding around a central post with steps that radiate from a common centre or several radii (see Figures 11.2.2d and 11.2.2e in the Housing Provisions).

Spread-of-Flame Index: The index number for spread of flame as determined by AS/NZS 1530.3.

Sprinkler alarm switch: For the purposes of Specification 23, a device capable of sending an electrical signal to activate an alarm when a residential sprinkler head is activated (e.g. a flow switch).

Stage: A floor or platform in a Class 9b building on which performances are presented before an audience.

Stairway platform lift: A power-operated device for raising or lowering people with limited mobility on a platform (with or without a chair) in the direction of a stairway.

Storey: A space within a building which is situated between one floor level and the floor level next above, or if there is no floor above, the ceiling or roof above, but not—

(a) a space that contains only—
   (i) a lift shaft, stairway or meter room; or
   (ii) a bathroom, shower room, laundry, water closet, or other sanitary compartment; or
   (iii) accommodation intended for not more than 3 vehicles; or
   (iv) a combination of the above; or
(b) a mezzanine.

Structural adequacy: In relation to an FRL, means the ability to maintain stability and adequate loadbearing capacity as determined by AS 1530.4.

Structural member: A component or part of an assembly which provides vertical or lateral support to a building or structure.

Substantive parts of a building or structure: Those parts of a building or other structure that serve the purpose for which the building or structure has been constructed, including but are not limited to—
(a) the whole of a building or structure; and
(b) any significant portion of a building or structure (such as habitable or non-habitable storey, a roof system, a floor system, a system of loadbearing walls and the like) which could result in loss of life or injury should it fail.

**Sudden failure:** Relatively rapid collapse of a structure that occurs with little warning with little plastic deformation and/or moment redistribution.

**Surface water:** All naturally occurring water, other than sub-surface water, which results from rainfall on or around the site or water flowing onto the site.

**Swimming pool:** Any excavation or structure containing water and principally used, or that is designed, manufactured or adapted to be principally used for swimming, wading, paddling, or the like, including a bathing or wading pool, or spa.

**Tapered tread:** A stair tread with a walking area that grows smaller towards one end.

**Thermal comfort level:** The level of thermal comfort in a building expressed as a PMV sensation scale.

**Total R-Value:** The sum of the **R-Values** of the individual component layers in a composite element including any building material, insulating material, airspace, thermal bridging and associated surface resistances, expressed in m².K/W.

(a) For the purposes of Volume One, the fraction of incident irradiance on a wall-glazing construction or a roof light that adds heat to a building's space.

(b) For the purposes of Volume Two, the fraction of incident irradiance on glazing or a roof light that adds heat to a building's space.

(a) For the purposes of Volume One, the thermal transmittance of the composite element allowing for the effect of any airspaces, thermal bridging and associated surface resistances, expressed in W/m².K.

(b) For the purposes of Volume Two, means the thermal transmittance of the composite element allowing for the effect of any airspaces and associated surface resistances, expressed in W/m².K.

**Transient actions:** The combination of structural actions in which the combined magnitude of the permanent gravity action and imposed gravity action is less than 50% of the magnitude of the total combined actions.

**Treatment area:** An area within a patient care area such as an operating theatre and rooms used for recovery, minor procedures, resuscitation, intensive care and coronary care from which a patient may not be readily moved.

**Uncontrolled discharge:** Any unintentional release of fluid from a plumbing and drainage system and includes leakage and seepage.

**Unique wall:** For the purposes of F1V1 in Volume One and H2V1 in Volume Two, a wall which is neither a cavity wall nor a direct fix cladding wall.

**Unobstructed opening:** For the purposes of Section 8 of the Housing Provisions, a glazed area that a person could mistake for an open doorway or clearway and walk into the glazed panel.

**Unreinforced masonry:** Masonry that is not reinforced.

**Vapour pressure:** The pressure at which water vapour is in thermodynamic equilibrium with its condensed state.

**Ventilation opening:** An opening in the external wall, floor or roof of a building designed to allow air movement into or out of the building by natural means including a permanent opening, an openable part of a window, a door or other device which can be held open.

**Verification Method:** A test, inspection, calculation or other method that determines whether a Performance Solution complies with the relevant Performance Requirements.

**Vessel:** For the purposes of Volume One and Part 10.2 of the Housing Provisions, an open, pre-formed, pre-finished concave receptacle capable of holding water, usually for the purpose of washing, including a basin, sink, bath, laundry tub and the like.

**Visibility:** The maximum distance at which an object of defined size, brightness and contrast can be seen and recognised.

**Voltage:** A difference of potential, measured in Volts (V) and includes extra-low voltage and low voltage.

(a) In relation to a building — the volume of the total space of the building measured above the lowest floor (including, for a suspended floor, any subfloor space), over the enclosing walls, and to the underside of the roof covering.

(b) In relation to a fire compartment — the volume of the total space of the fire compartment measured within the inner finished surfaces of the enclosing fire-resisting walls and/or floors, and—

(i) if there is no fire-resisting floor at the base of the fire compartment, measured above the finished surface of the lowest floor in the fire compartment; and

(ii) if there is no fire-resisting floor at the top of the fire compartment, measured to the underside of the roof.

NCC 2022 Volume Two - Building Code of Australia Page 190
covering of the fire compartment; and

(iii) if there is no fire-resisting wall, measured over the enclosing wall and if there is no enclosing wall, includes any space within the fire compartment that has a use which contributes to the fire load.

(c) In relation to an atrium — the volume of the total space of the atrium measured within the finished surfaces of the bounding construction and if no bounding construction, within the external walls.

Waffle raft: A stiffened raft with closely spaced ribs constructed on the ground and with slab panels supported between ribs.

Wall-glazing construction: For the purposes of Section J in Volume One, the combination of wall and glazing components comprising the envelope of a building, excluding—

(a) display glazing; and

(b) opaque non-glazed openings such as doors, vents, penetrations and shutters.

Ward area: That part of a patient care area for resident patients and may contain areas for accommodation, sleeping, associated living and nursing facilities.

Water control layer: A pliable building membrane or the exterior cladding when no pliable building membrane is present.

WaterMark Certification Scheme: The ABCB scheme for certifying and authorising plumbing and drainage products.

WaterMark Conformity Assessment Body (WMCAB): A conformity assessment body registered with and accredited by the JAS-ANZ to conduct evaluations leading to product certification and contracted with the administering body to issue the WaterMark Licence.

WaterMark Licence: A licence issued by a WaterMark Conformity Assessment Body.

WaterMark Schedule of Excluded Products: The list maintained by the administering body of products excluded from the WaterMark Certification Scheme.

WaterMark Schedule of Products: The list maintained by the administering body of products included in the WaterMark Certification Scheme, and the specifications to which the products can be certified.

Explanatory Information:
The WaterMark Schedule of Products and the WaterMark Schedule of Excluded Products can be viewed on the ABCB website at www.abcb.gov.au.

Waterproof: The property of a material that does not allow moisture to penetrate through it.

Waterproofing system: A combination of elements that are required to achieve a waterproof barrier as required by H4D2 and H4D3 including substrate, membrane, bond breakers, sealants, finishes and the like.

Water resistant: The property of a system or material that restricts moisture movement and will not degrade under conditions of moisture.

Water sensitive materials: Materials that have an inherent capacity to absorb water vapour and include timber, plasterboard, plywood, oriented strand board and the like.

Waterstop: A vertical extension of the waterproofing system forming a barrier to prevent the passage of moisture in the floor.

Watertight: Will not allow water to pass from the inside to the outside of the component or joint and vice versa.

Weighted average: Is calculated across the wetted surface area of a pipe, pipe fitting or plumbing fixture.

Wet area: An area within a building supplied with water from a water supply system, which includes bathrooms, showers, laundries and sanitary compartments and excludes kitchens, bar areas, kitchenettes or domestic food and beverage preparation areas.

Wetted surface area: Is calculated by the total sum of diameter (D) in contact with drinking water.

Winders: Treads within a straight flight that are used to change direction of the stair (see Figure 4).

Window: includes a roof light, glass panel, glass block or brick, glass louvre, glazed sash, glazed door, or other device which transmits natural light directly from outside a building to the room concerned when in the closed position.

Withstand: For the purposes of A8G3(1) means that in response to an imposed fire action the following conditions must not occur:

(a) Fire spread more than 5m above an opening in the façade through which flames are venting.
(b) **Fire spread more than 2m beyond the extent of flames from a burning item adjacent to the structure such as a vehicle, waste bin, collection of combustible rubbish depending on the use and access to adjacent areas.**

(c) **Ignition and propagation as the result of the imposed heat flux from a fire in an adjacent building or potential building on an adjoining allotment (embers are likely to be present and therefore piloted ignition should be considered if combustible materials are present).**

(d) **Ignition and fire propagation within cladding materials and building cavities.**

(e) **Release of flaming droplets.**

(f) **Release of significant quantities of debris (criteria should be developed during the PBDB process having regard for the proximity of other property and the requirements of the emergency services).**

(g) **Structural failure.**

**Explanatory Information:**

For item (f), the risk to life of occupants evacuating the building from falling debris should be evaluated under A8G2.

**Yield:** The mass of a combustion product generated during combustion divided by the mass loss of the test specimen as specified in the design fire.

**Zone protection:** The installation of a backflow prevention device at the point where a water service is connected to multiple fixtures or appliances, with no backflow prevention device installed as individual protection downstream of this point.

Table Notes:

1. For AS/NZ ISO 717.1:
   (i) Test reports based on AS 1276—1979 and issued prior to AS/NZS 1276.1—1999 being referenced in the NCC remain valid.
   (ii) The STC values in reports based on AS 1276—1979 shall be considered to be equivalent to $R_w$ values.
   (iii) Test reports based on AS/NZS 1276.1 prepared after the NCC reference date for AS/NZS 1276.1—1999 must be based on that version.
   (iv) Test reports based on ISO 717-1—1996 and issued prior to AS/NZS ISO 717.1—2004 being referenced in the NCC remain valid.
   (v) Reports based on AS/NZS ISO 717.1 relating to tests carried out after the NCC reference date for AS/NZS ISO 717.1—2004 must relate to the amended Standard.

2. For AS 1530 Parts 1 to 4:
   (i) Until 1 May 2022, subject to the note to AS 4072.1, reports relating to tests carried out under earlier editions of AS 1530 Parts 1 to 4 remain valid.
   (ii) Reports relating to tests carried out after the date of an amendment to a Standard must relate to the amended Standard.

3. For AS 1562.1, tests carried out based on AS 1562.1—1992 and issued prior to AS 1562.1—2018 being referenced in the NCC remain valid. Reports relating to tests carried out after the NCC reference date for AS 1562.1 must relate to the revised Standard.

4. For AS 1670.1, AS 1670.3 and AS1670.4:
   (i) Notwithstanding A4G1(5), until 1 May 2022 either the current edition or the previous editions of the documents listed in Table 1.8 of AS 1670.1, AS 1670.3 and AS 1670.4 may be used to meet the requirements of AS 1670.1, AS 1670.3 and AS 1670.4 as applicable.
   (ii) From 1 May 2022 A4G1(5) applies and only the edition of the documents listed in Table 1.8 of AS 1670.1, AS 1670.3 and AS 1670.4 that existed at the time of publication of the primary document may be used.
   (iii) For AS/NZS 1859.4, the 2004 edition has been retained for a transitional period ending on 30 April 2020.

5. For AS 2047:
   (i) Tests carried out under earlier editions of AS 2047 remain valid.
   (ii) Reports based on AS 2047 relating to tests carried out after the NCC reference date for AS 2047—2014 Amendment 2 must relate to the amended Standard.

6. For AS 3786:
   (i) Tests carried out under AS 3786—2014 Amendment 1 remain valid.
   (ii) Reports based on AS 3786 relating to tests carried out after the NCC reference date for AS 3786—2014 Amendment 2 must relate to the amended Standard.

7. Test reports based on the 2005 edition of AS/NZS 4020 will continue to be accepted until 1 May 2024. Test reports prepared after the NCC reference date for the

8. For AS 4072.1, until 1 May 2022, systems tested to AS 1530.4 prior to 1 January 1995 need not be retested to comply with the provisions in AS 4072.1.

9. For AS 4586:
   (i) Test reports based on the 2004 edition of AS/NZS 4586 and issued prior to the 2013 edition of AS 4586 being referenced in the NCC remain valid.
   (ii) Test reports prepared after the NCC reference date of the 2013 edition of AS 4586 must be based on that version.
   (iii) For the purposes of assessing compliance, the slip-resistance classifications of V, W and X in reports based on the 2004 edition of AS/NZS 4586 may be considered to be equivalent to slip-resistance classifications of P5, P4 and P3 respectively in the 2013 edition of AS4586.
   (iv) Test reports based on Appendix D of AS 4586—2013 and issued prior to the NCC reference date for AS 4586—2013 (incorporating Amendment 1) remain valid.
   (v) Test reports based on Appendix D of AS 4586—2013 and prepared after the NCC reference date for AS 4586—2013 (incorporating Amendment 1) must be based on that version.

10. Tests carried out based on AS/NZS 2918—2001 and issued prior to AS/NZS 2918—2018 being referenced in the BCA remain valid. Reports relating to tests carried out after the NCC reference date for AS/NZS 2918 must relate to the revised Standard.

11. For AS 2699 Parts 1 and 3:
   (i) For AS 2699.1, the 2000 edition has been retained for a transitional period ending on 30 April 2025.
   (ii) For AS 2699.3, the 2002 edition has been retained for a transitional period ending on 30 April 2025.
Footnote: Other legislation and policies affecting buildings
Footnote: Other legislation and policies affecting buildings

In addition to any applicable provisions of this Code, there are a number of other legislative technical requirements and policies affecting the design, construction and/or performance of buildings that practitioners may need to be aware of, including, but not necessarily limited to, the following list. Additional legislative instruments such as regulations, codes and standards may exist under the legislation listed.

1. Australian Capital Territory

Administering Agency
Department of Finance

Relevant Legislation
Australian Capital Territory (Planning and Land Management) Act 1988
Parliament Act 1974

2. Defence Buildings

Administering Agency
Department of Defence

Relevant Legislation
Defence Act 1903

Relevant Regulations
DefenceRegulation 2016, Part 11A

Relevant Codes, Standards and Publications
Manual of Fire Protection Engineering
Requirements for the Provision of Disabled Access and other Facilities for People with a Disability in Defence Heating, Ventilation and Air Conditioning Policy
Microbial Control in Air Handling and Water Systems of Defence Buildings
Building Energy Performance Manual
Manual of Infrastructure Engineering - Electrical
Manual of Infrastructure Engineering - Bulk Fuel Installation Design
Defence Communications Cabling Standard
Defence Training Area Management Manual
Defence Safety Manual
Defence Security Manual
Defence Explosive Ordinance Publications

The Defence Estate Quality Management System (http://www.defence.gov.au/estatemangement/governance/policy/principlesdevelopment/default.asp) contains further requirements including the principles of development, zone planning, site selection, engineering requirements and environmental impact assessment and approval requirements.

3. Disability Discrimination

Administering Agency
Attorney-General’s Department
Relevant Legislation
Disability Discrimination Act 1992
Disability (Access to Premises - Buildings) Standards 2010
Disability Standards for Accessible Public Transport 2002

4. Environment
Administering Agency

Department of Employment

Relevant Legislation
Work Health and Safety Act 2011
Work Health and Safety Regulations 2011

7. Territory of Christmas Island
Administering Agency
Department of Infrastructure and Regional Development

Relevant Legislation
Christmas Island Act 1958
Footnote: Other legislation affecting buildings
In addition to any applicable provisions of the Building Act 2004 and this Code, there are other legislative technical requirements affecting the design, construction and/or performance of buildings that practitioners may need to be aware of. A list of relevant legislation and links to where it can be found on the ACT Legislation Register can be found in the ACT Appendix at https://www.legislation.act.gov.au/a/2004-11/.
### Schedule 5  New South Wales

#### Section A  Governing requirements
- Part A6  Building classification
- NSW A6G7  Class 6 buildings

#### Section H  Class 1 and 10 buildings
- Part H1  Structure
- H1D4  Footings and slabs
- Part H2  Damp and weatherproofing
- NSW H2P3  Rising damp
- Part H7  Ancillary provisions and additional construction requirements
- NSW H7P1  Swimming pool access
- NSW H7D2  Swimming pools
- NSW H7D4  Construction in bushfire prone areas

#### Schedule 1  Definitions

Footnote: Other legislation affecting buildings
Part A6  Building classification

*Insert clause NSW A6G7 as follows:*

NSW A6G7  Class 6 buildings

[2019: NSW A6.6]

A Class 6 building is a shop or other building for sale of goods by retail or the supply of services direct to the public, including—

(a) an eating room, café, restaurant, milk or soft drink bar; or

(b) a dining room, bar, shop or kiosk part of a hotel or motel; or

(c) a hairdresser’s or barber’s shop, public laundry, or undertaker’s establishment; or

(d) market or sale room, showroom, or *service station.*
Part H1  Structure

H1D4  Footings and slabs

[2019: 3.2.0, 3.2.1]

Delete H1D4(1) and replace with NSW H1D4(1) as follows:

(1) Performance Requirement H1P1 is satisfied for footings and slabs if they are installed in accordance with either (a) or (b):

(a) One of the following:

(i) The footing or slab is constructed in accordance with AS 2870 except that for the purposes of Clause 5.3.3.1 of AS 2870 a damp-proofing membrane is required to be provided.

(ii) Piled footings are designed in accordance with AS 2159.

(b) Subject to (2), Section 4 of the ABCB Housing Provisions.

Part H2  Damp and weatherproofing

Insert clause NSW H2P3 as follows:

NSW H2P3  Rising damp

[2019: NSW P2.2.3]

(1) Moisture from the ground must be prevented from causing—

(a) unhealthy or dangerous conditions, or loss of amenity for occupants; and

(b) undue dampness or deterioration of building elements.

(2) Barriers installed beneath slab on ground construction for the purposes of (1) must have a high resistance to damage during construction.

Limitations:

NSW H2P3 does not apply to a Class 10 building where in the particular case there is no necessity for compliance.

Explanatory Information:
The intent of requiring the barrier to have a high resistance to damage during construction is to increase the barrier’s ability to resist punctures during construction. By being less susceptible to puncturing, the barrier will provide increased protection against moisture containing dissolved salts from coming into contact with the concrete slab.

Part H7  Ancillary provisions and additional construction requirements

Insert clause NSW H7P1 as follows:

NSW H7P1  Swimming pool access

[2019: NSW P2.7.1]

A barrier must be provided to a swimming pool and must—

(a) be continuous for the full extent of the hazard; and

(b) be of a strength and rigidity to withstand the foreseeable impact of people; and
(c) restrict the access of young children to the pool and the immediate pool surrounds; and
(d) have any gates and doors fitted with latching devices not readily operated by young children, and constructed to automatically close and latch.

**Applications:**

H7P1 only applies to a swimming pool with a depth of water more than 300 mm, in conjunction with the Swimming Pools Act 1992 and the Swimming Pools Regulation 2018.

---

Insert clause NSW H7D2 as follows:

**NSW H7D2  Swimming pools**

[2019: NSW 3.10.1.0]

(1) **Performance Requirement** H7P1 is satisfied for a *swimming pool* with a depth of water more than 300 mm and which is associated with a Class 1 building, if it has safety barriers installed in accordance with—

(a) AS 1926 Parts 1 and 2; or
(b) if the *swimming pool* is a *spa pool*—
   (i) the requirements of (1)(a); or
   (ii) clause 9 of the Swimming Pools Regulation 2018.

(2) **Performance Requirement** H7P2 is satisfied for a water recirculation system of a swimming pool with a depth of water more than 300 mm, if it complies with AS 1926.3.

---

**Applications:**

NSW H7D2 applies in New South Wales to the technical construction requirements for barriers to restrict access to *swimming pools*, subject to out-of-ground pool walls and the walls of above ground pools, including inflatable pools, not being considered to be effective barriers.

---

**Notes:**

The Swimming Pools Act 1992 and the Swimming Pool Regulation 2018, applicable to *swimming pools* with a depth of water of more than 300 mm, regulate the circumstances in which a barrier is required and prevail in the case of any inconsistency.

---

Insert clause NSW H7D4 as follows:

**NSW H7D4  Construction in bushfire prone areas**

[2019: NSW 3.10.5.0]

(1) The requirements of (2) to (5) only apply in a designated bushfire prone area.

(2) **Performance Requirement** H7P5 is satisfied for a Class 1 building, or a Class 10a building or deck associated with a Class 1 building, if it is constructed in accordance with—

(a) AS 3959; or
(b) NASH Standard – Steel Framed Construction in Bushfire Areas.

(3) For the purposes of (2)(a), AS 3959 applies except—

(a) as amended by *Planning for Bush Fire Protection*; and
(b) for Section 9 for Bushfire Attack Level FZ (BAL-FZ).

(4) For the purposes of (2)(b), NASH Standard - Steel Framed Construction in Bushfire Areas applies except—

(a) as amended by *Planning for Bush Fire Protection*; and
(b) for buildings subject to Bushfire Attack Level FZ (BAL-FZ).
(5) The requirements of (2), (3) and (4) apply as modified by—

(a) development consent following consultation with the NSW Rural Fire Service under section 4.14 of the Environmental Planning and Assessment Act 1979 if required; or

(b) development consent with a bushfire safety authority issued under section 100B of the Rural Fires Act 1997 for the purposes of integrated development.

Explanatory Information:
In New South Wales, buildings subject to BAL-FZ must comply with specific conditions of development consent for construction at this level.
### Schedule 1  Definitions

**Aisle:** A walkway at the end of *rows* of seating, not being *continental seating*, leading to a cross-over or to an egress doorway.

**Appropriate authority:** The relevant authority with the responsibility to determine the particular matter.

**Assembly building:** A building where people may assemble for—

(a) civic, theatrical, social, political or religious purposes including a library, theatre, public hall or place of worship; or

(b) educational purposes in a *school, early childhood centre*, preschool, or the like; or

(c) entertainment, recreational or sporting purposes including—

(i) a cinema; or

(ii) a sports stadium, sporting or other club; or

(d) transit purposes including a bus station, railway station, airport or ferry terminal.

**Designated bushfire prone area:** Land that:

(a) has been designated under legislation; or

(b) has been identified under an environmental planning instrument, development control plan or in the course of processing and determining a development application, as land that can support a bushfire or is likely to be subject to bushfire attack.
In addition to any applicable provisions of the Environmental Planning and Assessment Act 1979, the Environmental Planning and Assessment Regulation 2000 and this Code, there is a variety of other regulatory provisions, including legislation, regulation and departmental policies that impose requirements affecting the design, construction and/or performance of buildings in NSW.

The following is a non-definitive list of such provisions. It does not include Commonwealth provisions that may apply in NSW, nor planning and environmental standards that may impose building requirements in individual circumstances. It is meant as an indicative guide only and is not to be relied upon in any way as a substitute for further research, investigation and legal advice needed to determine building standards in individual circumstances.

1. Boarding Houses

Administering Agency
Department of Family and Community Services – Ageing, Disability and Home Care

Schedule 6  Northern Territory

**Section H  Class 1 and 10 buildings**

- Part H2  Damp and weatherproofing
- NT H2P4  Drainage from swimming pools
- Part H4  Health and amenity
- NT H4P6  Sound insulation
- NT H4V4  Sound insulation
- Part H7  Ancillary provisions and additional construction requirements
- NT H7P1  Swimming pool access
- H7D2  Swimming pools

**Footnote:** Other legislation affecting buildings
Part H2  Damp and weatherproofing

Delete H2P4 and insert NT H2P4 as follows:

NT H2P4  Drainage from swimming pools

This clause has deliberately been left blank.

Part H4  Health and amenity

Insert clause NT H4P6 as follows:

NT H4P6  Sound insulation

[2019: NT P2.4.6]

(1) Walls separating dwellings must provide insulation against the transmission of airborne and impact generated sound sufficient to prevent illness or loss of amenity to the occupants.

(2) The required sound insulation of walls must not be compromised by the incorporation or penetration of a pipe or other service element.

Delete H4V4 and insert NT H4V4 as follows:

NT H4V4  Sound insulation

This clause has deliberately been left blank.

Part H7  Ancillary provisions and additional construction requirements

Delete H7P1 and insert NT H7P1 as follows:

NT H7P1  Swimming pool access

This clause has deliberately been left blank.

Restriction of access to swimming pools in the Northern Territory is regulated under the Swimming Pool Safety Act.

Restriction of access to swimming pools in the Northern Territory is regulated under the Swimming Pool Safety Act.

H7D2  Swimming pools

[2019: 3.10.1]
In addition to any applicable provisions of the Building Act, Building Regulations and this Code, there are a number of other legislative technical requirements affecting the design, construction and/or performance of buildings that practitioners may need to be aware of, including, but not necessarily limited to, the following list. Additional legislative instruments such as regulations, codes and standards may exist under the legislation listed.

- QLD H7P1  Swimming pool access
- H7D2  Swimming pools
- H7D4  Construction in bushfire prone areas

Schedule 1  Definitions

Footnote: Other legislation affecting buildings
Section H  Class 1 and 10 buildings

Part H1  Structure

Delete H1P2 and insert QLD H1P2 as follows:

QLD H1P2  Buildings in flood areas

This clause has deliberately been left blank.

Building work in designated flood hazard areas is regulated by the Building Act 1975 and Development Code 3.5 - Construction of buildings in flood hazard areas.

Insert clause QLD H1P3 as follows:

QLD H1P3  Termite management measures

[2019: QLD P2.1.3]

(1) The risk of a Class 1 or 10 building being damaged by subterranean termites must be adequately minimised by the use of a suitable termite management measure that—

(a) if it serves a non-temporary Class 1 building, has a design life of at least 50 years; or

(b) if it serves a building not specified in (a), has a design life of at least 50 years or the specified design life of the building, whichever is the lesser; or

(c) is easily and readily accessible for replenishment or replacement and is capable of being replenished or replaced.

(2) A termite management measure required by (1), to the degree necessary, must—

(a) be accessible to enable the installation, maintenance and inspection of the termite management measure to be carried out; and

(b) incorporate suitable measures to adequately minimise the risk of the termite management measure inadvertently being damaged, bridged or breached.

Explanatory Information:

QLD H1P3(1) requires a termite management measure in Queensland to have a design life of at least 50 years unless it is easily and readily accessible for replenishment or replacement and is capable of being replenished or replaced. In recognition that some buildings other than non-temporary Class 1 buildings may be designed to last less than 50 years, the option of the termite management measure having a design life at least equal to that specified for the building is given. If this option is used, the design life of the building should be agreed upon by all relevant stakeholders at the design stage and should form part of the documentation kept by the appropriate authority. It should not be assumed that the design life of 50 years in QLD H1P3(1)(a) and (b) applies to any other provisions of the BCA, unless stated.

An example of a termite management measure that may satisfy QLD H1P3(1)(c) is a chemical reticulation system beneath a concrete floor slab laid directly on the ground, provided that the system is easily and readily accessible for replenishment and is capable of being replenished.

An example of a termite management measure that may not satisfy QLD H1P3(1) for a non-temporary Class 1 building is a hand-sprayed chemical beneath a concrete floor slab laid directly on the ground if the chemical does not have a design life of at least 50 years. The concrete floor slab being laid directly on the ground would prevent the area beneath the slab from being easily and readily accessible for replenishment or replacement of the termite management measure.

An example of a termite management measure being inadvertently bridged or breached is when a person places a garden or mulch over the top of or above the level of a termite management measure enabling termites to bypass the measure.
H1D3  Site preparation

Delete H1D3(3) and replace with QLD H1D3(3) as follows:

(3) Compliance with Part 3.4 of the ABCB Housing Provisions satisfies Performance Requirement H1P1 and QLD H1P3.

H1D6  Framing

Delete H1D6(54) and replace with QLD H1D6(54) as follows:

(54) Performance Requirement H1P1 is satisfied for a timber frame if it is designed and constructed in accordance with the following, as appropriate:

(a) Design of timber structures: AS 1720.1.
(b) Design of nailplated timber roof trusses: AS 1720.5.
(c) Residential timber-framed construction – non-cyclonic areas: AS 1684.2.
(d) Residential timber-framed construction – cyclonic areas: AS 1684.3.
(e) Residential timber-framed construction – non-cyclonic areas (simplified): AS 1684.4.
(f) Installation of particleboard flooring: AS 1860.2.
(g) Timber species: In addition to sub-clauses (a) to (f) above, timber used for structural purposes must be a species scheduled for the appropriate use in Schedules A, B or C of Book 2 of the December 2017 version of the “Queensland Government, Department of Agriculture, Fisheries and Forestry - Construction timbers in Queensland, Book 1 and Book 2: Properties and specifications for satisfactory performance of construction timbers in Queensland - Class 1 and 10 buildings (Houses, carports, garages, greenhouses and sheds)”.

Delete H1D10 and insert QLD H1D10 as follows:

QLD H1D10  Flood hazard areas

This clause has deliberately been left blank.

Building work in designated flood hazard areas is regulated by the Building Act 1975 and the Queensland Development Code 3.5 - Construction of buildings in flood hazard areas.

Part H7  Ancillary provisions and additional construction requirements

Delete H7P1 and insert QLD H7P1 as follows:

QLD H7P1  Swimming pool access

This clause has deliberately been left blank.

Restriction of access to swimming pools in Queensland is regulated under the Building Act 1975.

H7D2  Swimming pools

Restriction of access to swimming pools in Queensland is regulated under the Building Act 1975.

H7D4  Construction in bushfire prone areas

Insert subclause QLD H7D4(3) in clause H7D4 as follows:

(3) The requirements of (2) do not apply when, in accordance with AS 3959, the classified vegetation is Group F rainforest...
(excluding wet sclerophyll forest types), mangrove communities or grasslands under 300 mm high.
Schedule 1  Definitions

(a) A member of a building specifically designed to take part of the building loads and includes roof, ceiling, floor, stairway or ramp and wall framing members including bracing members designed for the specific purpose of acting as a brace to those members.

(b) Door jambs, window frames and reveals, architraves and skirtings.
All legislative technical requirements affecting the design, construction and/or performance of buildings are consolidated into the Building Act 1975 and other legislative instruments under that Act, such as regulations, codes (including this Code) and standards.

- **H7D2**  Swimming pools
- **Specification 42**  Heating and cooling loads
- **S42C2**  Heating and cooling loads

## Schedule 1  Definitions

**Footnote: Other legislation affecting buildings**
Part A6 Building classification

Insert clause SA A6G7 as follows:

SA A6G7 Class 6 buildings

[2019: SA A6.6]

A Class 6 building is a shop or other building for the sale of goods by retail or the supply of services direct to the public, including—

(a) an eating room, cafe, restaurant, milk or soft drink bar; or

(b) a dining room, bar, shop or kiosk part of a hotel or motel; or

(c) a hairdresser’s or barber’s shop, public laundry, or undertaker’s establishment; or

(d) market or sale room, showroom, or service station; or

(e) a small arts venue.
Part H1  Structure

Delete H1P2 and insert SA H1P2 as follows:

SA H1P2  Buildings in flood areas

This clause has deliberately been left blank.

Part H2  Damp and weatherproofing

Insert clause SA H2P3 as follows:

SA H2P3  Rising damp

[2019: SA P2.2.3]

(1) Moisture from the ground must be prevented from causing—

(a) undue dampness or deterioration of building elements; and

(b) unhealthy or dangerous conditions, or loss of amenity for occupants.

(2) Barriers installed to prevent transfer of moisture from the ground must have—

(a) high resistance to moisture penetration; and

(b) high resistance to damage during construction; and

(c) high resistance to degradation by dissolved salts.

H2D4  Masonry

[2019: 3.3.4]

Delete H2D4(24) and replace with SA H2D4(24) as follows:

(24) Performance Requirements H2P2 and H2P3 are satisfied for weatherproofing of masonry if it is carried out in accordance with the appropriate provisions of—

(a) AS 3700 - Masonry structures; or

(b) AS 4773 - Masonry for small buildings, Parts 1 and 2.

Insert subclause SA H2D4(35) in clause H2D4 as follows:

(35) For the purposes of SA H2D4(2), metals and bitumen-coated metals referred to in clauses 7.2. and 7.3 of AS/NZS 2904 are not acceptable materials for use as damp-proof courses in South Australia.

Insert subclause SA H2D4(4) in clause H2D4 as follows:

(4) In low rainfall intensity areas where the site classification is A, S, M, M-D, H, H1, H2, H-D, H1-D or H2-D in accordance with AS 2870, the height of the damp-proof course may be —

(a) 15 mm above finished paved, concreted or landscaped areas; or

(b) 0 mm if the damp-proof course is protected from the direct effects of the weather by a carport, verandah or the like.
Part H3  Fire safety

H3P1  Spread of fire

Delete H3P1(1) and replace with SA H3P1(1) as follows:

(1) A Class 1 building must be protected from the spread of fire from—
   (a) another building other than an associated Class 10 building; and
   (b) the allotment boundary, other than a boundary adjoining a road or public space; and
   (c) a Class 10b brush fence.

Part H7  Ancillary provisions and additional construction requirements

H7D2  Swimming pools

Insert subclause SA H7D2(3) in clause H7D2 as follows:

(3) For the purpose of clause 6.1.1 of AS 1926.3, a skimmer box is an outlet and must have a means of releasing the vacuum pressure should the suction become blocked.

Specification 42  Heating and cooling loads

S42C2  Heating and cooling loads

Delete S42C2(1) and replace with SA S42C2(1) as follows:

(1) A building must achieve an energy rating, including the separate heating and cooling load limits, using , of greater than or equal to—
   (a) 6 stars; or
   (b) for a building in climate zones 1 or 2, 5.5 stars if the building has an outdoor living area as described in (3) if the outdoor living area—
      (i) is fully covered with an impervious roof having a greater than or equal to 1.5 (for downward heat flow); or
      (ii) has at least one permanently installed ceiling fan; or
   (c) for a building in climate zones 1 or 2, 5 stars if the building has an outdoor living area as described in (3) if the outdoor living area—
      (i) is fully covered with an impervious roof having a greater than or equal to 1.5 (for downward heat flow); and
      (ii) has at least one permanently installed ceiling fan; or
   (d) for an elevated building with a lightweight flooring system that has a floor area up to and including 60 m$^2$—5 stars; or
   (e) for an elevated building with a lightweight flooring system that is located in climate zone 4, a local government area listed in (7), or an area not within a local government council and it has an on-site renewable energy source provided in accordance with (6) installed and connected to the building—5 stars.

Insert subclause SA S42C2(6) in clause S42C2 as follows:

(6) The minimum level of energy generated annually by on-site renewable energy source provided in accordance with (1)(e) must be determined by multiplying the floor area of the building by the appropriate value in SA Table S42C2 for the energy rating achieved by the building.

Insert subclause SA S42C2(7) in clause S42C2 as follows:

(7) The local government areas where (1)(e) applies are:
   (a) Ceduna Council.
(b) Cleve Council.
(c) The Coorong District Council.
(d) Elliston Council.
(e) Flinders Ranges Council.
(f) Franklin Harbour Council
(g) Goyder Council.
(h) Kangaroo Island Council.
(i) Kooroonga East Murray Council.
(j) Kimba Council.
(k) Lower Eyre Peninsula Council.
(l) Mid Murray Council.
(m) Mount Remarkable Council.
(n) Orroroo Carrieton Council.
(o) Peterborough Council.
(p) Southern Mallee Council.
(q) Streaky Bay Council.
(r) Tatiara Council.
(s) Tumby Bay Council.
(t) Wudinna Council

Insert SA Table S42C2 as follows:

**SA Table S42C2:** Required minimum level of energy to be generated by an on-site renewable energy source

<table>

Assembly building: A building where people may assemble for—
(a) civic, theatrical, social, political or religious purposes including a library, theatre, public hall or place of worship; or
(b) educational purposes in a school, early childhood centre, preschool, or the like; or
(c) entertainment, recreational or sporting purposes including—
(i) a discotheque or nightclub; or
(ii) a cinema; or
(iii) a sports stadium, sporting or other club; or
(d) transit purposes including a bus station, railway station, airport or ferry terminal.

Farm building: A single storey Class 7 or 8 building that is—
(a) primarily associated with agriculture and located on land used primarily for agriculture; and
(b) the total number of people accommodated in the building does not exceed one person per 200 m$^2$ of total floor area, or six people, whichever is greater; and
(c) the floor area of each building does not exceed the maximum floor area and volume specified in Table SA 1 for the type of farm building; and
(d) the building does not contain occupancies of excessive fire hazard as listed in E1D5 to E1D12; and
(e) if the building is used for the storage of hay, an open space complying with C3D5(1) is provided around the perimeter of each building.

Schedule 1  Definitions
Footnote: Other legislation affecting buildings
Interpreting the NCC

A1G14 Interpretation

[2019: A1.0]

Insert subclause TAS A1G14(7) in clause A1G14 as follows:

(7) The Director of Building Control may issue written advice to deal with arising issues such as interpretation of codes, standards and regulations.

Referenced documents

A4G1 Referenced documents

[2019: A4.0]

Delete A4G1(3) and replace with TAS A4G1(3) as follows:

(3) The following applies:

(a) Where a new edition, issue or amendment of a primary referenced document is not listed under Schedule 32, for the purposes of the PCA the new addition, issue or amendment shall be referenced upon the publication of that addition, issue or amendment.

(b) All Tasmanian legislative documents referenced within the PCA are taken to be the latest published versions thereof unless noted otherwise.

Documentation of design and construction

A5G4 Evidence of suitability — Volume Three (PCA)

[2019: A5.3]

Delete A5G4(1) and replace with TAS A5G4(1) as follows:

(1) The following applies:

(a) Any product that is intended for use in contact with drinking water must comply with the relevant requirements of AS/NZS 4020 in the form of either—

(i) a test report provided by a certification body or NATA accredited testing laboratory, in accordance with AS/NZS 4020; or

(ii) a WaterMark Licence issued in accordance with (2) if it includes compliance with AS/NZS 4020.

(b) Product certification and authorisation must comply with the procedures set out in the WaterMark Certification Scheme (see ABCB website for details), Tas Part I101 or Tas Part I102 (as appropriate).

Delete A5G4(34) and replace with TAS A5G4(34) as follows:

(34) A product of a type listed on the WaterMark Schedule of Excluded products requires evidence of suitability in the form of—

(a) a current certificate issued by a certification body stating that the properties and performance of a product can meet the requirements of the PCA; or

(b) a report issued by a NATA accredited testing laboratory which—

(i) demonstrates that the product complies with the relevant requirements of the PCA; and

(ii) sets out the tests the product has been submitted to and the results of those tests and any other relevant information that has been relied upon to demonstrate suitability for the use in a plumbing or drainage installation.

Delete A5G4(56) and replace with TAS A5G4(56) as follows:

(56) Evidence to support that a design or system meets the relevant PCA Performance Requirements must be in the form of any one or any combination of the following:
(a) The design or system complies with a Deemed-to-Satisfy Provision.

(b) The design or system is a Performance Solution from a professional engineer or a recognised expert that—
   (i) certifies that the design or system complies with the relevant requirements of the PCA; and
   (ii) sets out the basis on which it is given and the extent to which relevant standards, specifications, rules, codes of practice or other publications have been relied upon; and
   (iii) meets the requirements of TAS Part I101 or TAS Part I102 (as appropriate).

*Insert subclause TAS A5G4(67) in clause A5G4 as follows:*

(67) Any new or innovative material or product must be assessed, certified and authorised — if required — in accordance with the WaterMark Certification Scheme (see ABCB website for details), Tas Part I101 or Tas Part I102 (as appropriate) prior to their use in a plumbing or drainage installation.

*Insert subclause TAS A5G4(78) in clause A5G4 as follows:*

(78) A material or product excluded from certification under the Plumbing Code of Australia is authorised for use in a plumbing or drainage installation if—
   (a) it is certified as complying with the appropriate Australian Standard(s); or
   (b) other evidence of suitability can be provided in accordance with TAS A5G4(5)(b)(iii).

*Insert subclause TAS A5G4(89) in clause A5G4 as follows:*

(89) A material or product used in a fire-fighting water service is authorised for use if it is certified by a recognised expert as complying with the relevant Australian Standards for the specific application in accordance with TAS A5G4(5)(b)(iii).

*Insert subclause TAS A5G4(910) in clause A5G4 as follows:*

(910) A material or product used in a stormwater installation is authorised for use if it is certified by a recognised expert as complying with Section 2 of AS/NZS 3500.3 in accordance with TAS A5G4(5)(b)(iii).

*Insert subclause TAS A5G4(1011) in clause A5G4 as follows:*

(1011) A prefabricated or constructed on-site cold-water storage tank used in a drinking water supply system is authorised for use if evidence of compliance with Tas Part B101 in accordance with TAS A5G4(5)(b)(iii) is given.
Part H7 Ancillary provisions and additional construction requirements

Insert clause TAS H7P3 as follows:

TAS H7P3 Heating appliances

A heating appliance and its associated components within a building, including an open fire-place, chimney, or the like, must be installed—

(a) to withstand the temperatures likely to be generated by the appliance; and

(b) so that it does not raise the temperature of any building element to a level that would adversely affect the element’s physical or mechanical properties or function; and

(c) so that hot products of combustion will not—
   (i) escape through the walls of the associated components; and
   (ii) discharge in a position that will cause fire to spread to nearby combustible materials or allow smoke to penetrate through nearby windows, ventilation inlets, or the like in the building containing the heating appliance; and
   (iii) in the case of solid-fuel burning appliances, be discharged above appropriate emission limits.

Insert clause TAS H7P5 as follows:

TAS H7P5 Buildings in bushfire prone areas

A Class 1 building or a Class 10a building or deck associated with a Class 1 building that is constructed in a must, to the degree necessary, be—

(a) designed and constructed to reduce the risk of ignition from a bushfire, appropriate to the—
   (i) potential for ignition caused by burning embers, radiant heat or flame generated by a bushfire; and
   (ii) intensity of the bushfire attack on the building; and

(b) provided with vehicular access to the site to assist fire fighting and emergency personnel defend the building or evacuate occupants; and

(c) provided with access at all times to a sufficient supply of water for fire fighting purposes on the site.
Early childhood centre: Any premises or part thereof providing or intending to provide a centre-based education and care service within the meaning of the Education and Care Services National Law Act 2010 (Vic), the Education and Care Services National Regulations and centre-based services that are licensed or approved under State and Territory children’s services law, but excludes—

(a) education and care primarily provided to school aged children in outside school hours settings; and

(b) services licensed as centre-based care class 4 under the Child Care Act.

Expert Judgement: For Volume Three, the judgement of a person who has the qualifications and expertise to determine whether a Plumbing or Drainage Solution complies with the Performance Requirements.

Explanatory Information:
The level of qualification and/or experience required to determine whether a Plumbing or Drainage Solution complies with the Performance Requirements may differ depending on the degree of complexity and the requirements of the Tasmanian Building Act. Practitioners should seek advice from the Permit Authority.

Network Utility Operator: A person who—

(a) undertakes the piped distribution of drinking water or non-drinking water for supply; or

(b) is the operator of a sewerage system or a stormwater drainage system.

On-site wastewater management system: An on-site wastewater management system as defined by the Tasmanian Building Act.

Professional engineer: A person who is an engineer accredited under the Tasmanian Building Act in the relevant discipline who has appropriate experience and competence in the relevant field.

Recognised expert: A person with qualifications and experience in the area of plumbing or drainage in question, as determined by the Director of Building Control.
In addition to any applicable provisions of the Building Act and other legislative and regulatory instruments under that Act, such as regulations, codes (including this Code) and standards there may be a number of other legislative technical requirements, and regulatory instruments affecting the design, construction and/or performance of buildings of which practitioners may need to be aware. Additional legislative and regulatory instruments such as regulations, codes and standards may apply.

All referenced documents including legislation, codes, Australian Standards, guidelines and codes of practice are the version current at the time of the project documentation approval, unless noted otherwise.

**Schedule 1**  
**Definitions**

**Footnote: Other legislation affecting buildings**
Delete H1D7(4) and replace with VIC H1D7(4) as follows:

(4) Performance Requirement H1P1 is satisfied for gutters and downpipes if they are designed and constructed in accordance with AS/NZS 3500.3.

(5)

Insert clause VIC H1D10 as follows:

VIC H1D10 Flood hazard areas

(1) Performance Requirement H1P2 for Class 1 buildings constructed in a flood hazard area is satisfied if the building is constructed in accordance with the ABCB Standard for Construction of Buildings in Flood Hazard Areas.

(2) The definitions of flood hazard area and freeboard in the ABCB Standard for Construction of Buildings in Flood Hazard Areas are replaced with those in Vic Schedule 3.

(3) The definition of defined flood level in the ABCB Standard for Construction of Buildings in Flood Hazard Areas is replaced with that in Schedule 3.

Part H6 Energy efficiency

Insert clause VIC H6P1 as follows:

VIC H6P1 Building

A building must have, to the degree necessary, a level of thermal performance to facilitate the efficient use of energy for artificial heating and cooling and a level of water use performance to facilitate the efficient use of water, appropriate to—

- the function and use of the building; and
- the internal environment; and
- the geographic location of the building; and
- the effects of nearby permanent features such as topography, structures and buildings; and
- solar radiation being—
  - utilised for heating; and
  - controlled to minimise energy for cooling; and
- the sealing of the building envelope against air leakage; and
- the utilisation of air movement to assist cooling; and
- water resources available; and
- pertinent water management measures of the responsible water authority.
Insert clause VIC H6P2 as follows:

**VIC H6P2**  Services

[2019: VIC P2.6.2]

(1) *Domestic services*, including any associated distribution system and components must, to the degree necessary—

(a) have features that facilitate the efficient use of energy appropriate to—
   
   (i) the *domestic service* and its usage; and
   
   (ii) the geographic location of the building; and
   
   (iii) the location of the *domestic service*; and
   
   (iv) the energy source; and

(b) obtain heating energy from—

   (i) a source that has a greenhouse gas intensity that does not exceed 100 g CO₂-e/MJ of thermal energy load; or

   (ii) an on-site *renewable energy* source; or

   (iii) another process such as reclaimed energy.

(2) The requirements of (1) do not apply to a hot water supply system.

**Explanatory Information:**

*In Victoria, the design and installation of a hot water supply system is regulated under the Plumbing Regulations 2018.*

Insert clause VIC H6V1 as follows:

**VIC H6V1**  Application of H6V2 and H6V3

[2019: VIC V2.6.1]

The *Verification Methods* in this Part only apply to—

(a) a new Class 1 building that has either a rainwater tank connected to all sanitary flushing systems, or a solar water heater system, installed in accordance with the Plumbing Regulations 2018; and

(b) a Class 1 building other than a new Class 1 building; and

(c) an enclosed Class 10a building attached to a Class 1 building.

**H6D2**  Application of Part H6

[2019: 3.12.0]

*Insert subclause VIC H6D2(3) in clause H6D2 as follows:*

(3) For the purposes of (1)(a) or (b), in the case of a new Class 1 building, the building must have either a rainwater tank connected to all sanitary flushing systems, or a solar water heater system, installed in accordance with the Plumbing Regulations 2018.
Early childhood centre: Includes—

(a) any premises, or part thereof, providing or intending to provide a centre-based education and care service within the meaning of the Education and Care Services National Law Act 2010, and the Education and Care Services National Regulations, excluding a service where education and care is primarily provided to school aged children; and

(b) a children’s service.

Flood hazard area: The site (whether or not mapped) encompassing land in an area liable to flooding within the meaning of Regulation 153 of the Building Regulations 2018.

Freeboard: The minimum height of the lowest floor of the building above the defined flood level, regulated by the relevant planning scheme, or specified or otherwise determined by the relevant council under Regulation 153 of the Building Regulations 2018 (see Figure 3).
In addition to any applicable provisions of the Building Act 1993, Building Regulations 2018 and this Code, there are a number of other legislative technical requirements affecting the design, construction and/or performance of buildings that practitioners may need to be aware of, including, but not necessarily limited to, the following list. Additional legislative instruments such as regulations, codes and standards may exist under the legislation listed.

1. Accommodation – Residential (Boarding Houses, Guest Houses, Hostels, Motels)

   **Administering Agency**
   Department of Health and Human Services
   Consumer Affairs Victoria
   Municipal council

   **Relevant Legislation**
   Public Health and Wellbeing Act 2008
   Public Health and Wellbeing Regulations 2009
   Residential Tenancies Act 1997
   Residential Tenancies (Rooming House Standards) Regulations 2012

2. Alpine Resorts

   **Administering Agency**
   Department of Environment, Land, Water and Planning
   Alpine Resorts Management Boards

   **Relevant Legislation**
   Alpine Resorts (Management) Act 1997

3. Asbestos Removal

   **Administering Agency**
   Victorian WorkCover Authority
   Environment Protection Authority

   **Relevant Legislation**
   Occupational Health and Safety Act 2004
   Environment Protection Act 1970

4. Crown Land

   **Administering Agency**
   Department of Environment, Land, Water and Planning
   Crown Land committees of management

   **Relevant Legislation**
   Crown Land (Reserves) Act 1978
5. Electrical Installations

**Administering Agency**
Energy Safe Victoria
Electrical transmission and distribution companies

**Relevant Legislation**
Electricity Industry Act 2000
Electricity Industry (Residual Provisions) Act 1993
Electricity Safety Act 1998
State Electricity Commission Act 1958
Electricity Safety (Installations) Regulations 2009
Standards Australia Wiring Rules, AS/NZS 3000/3013

6. Fences - dividing

**Administering Agency**
Department of Justice and Regulation
Dispute Settlement Centre of Victoria

**Relevant Legislation**
Fences Act 1968

7. Fire Prevention in Existing Buildings

**Administering Agency**
Municipal council

**Relevant Legislation**
Building Act 1993
Building Regulations 2018

8. Gas Installations

**Administering Agency**
Energy Safe Victoria

**Relevant Legislation**
Gas Industry Act 2001
Gas Safety Act 1997
Gas Safety (Gas Installation) Regulations 2008
AS/NZS 5601 Gas Installations

9. Historic Buildings

**Administering Agency**
Department of Environment, Land, Water and Planning
Executive Director under the Heritage Act 2017
Relevant Legislation
Heritage Act 2017

10. Moveable Dwellings (in Caravan Parks)

Administering Agency
Department of Environment, Land, Water and Planning
Municipal council

Relevant Legislation
Residential Tenancies Act 1997
Residential Tenancies (Caravan Parks and Moveable Dwellings Registration and Standards) Regulations 2010

11. Occupational Health and Safety

Administering Agency
Victorian WorkCover Authority

Relevant Legislation
Occupational Health and Safety Act 2004
Occupational Health and Safety Regulations 2017
Codes of practice published by the Victorian WorkCover Authority

12. Planning Controls

Administering Agency
Department of Environment, Land, Water and Planning
Municipal council

Relevant Legislation
Planning and Environment Act 1987
Planning schemes

13. Sanitary Plumbing, Water Supply and Sewerage

Administering Agency
Victorian Building Authority

Relevant Legislation
Building Act 1993
Plumbing Regulations 2018
Plumbing Code of Australia
AS/NZS 3500 Plumbing and Drainage

14 Septic Tank Installations

Administering Agency
Environment Protection Authority
Municipal council
Relevant Legislation
Environment Protection Act 1970
Guidelines For Environmental Management: Code of Practice-Onsite wastewater management

15. Subdivision of Buildings

Administering Agency
Department of Environment, Land, Water and Planning
Municipal council

Relevant Legislation
Subdivision Act 1988
Footnote: Other legislation affecting buildings
In addition to any applicable provisions of the Building Act 2011, Building Regulations 2012 and this Code, there are a number of other legislative technical requirements affecting the design, construction and/or performance of buildings that practitioners may need to be aware of, including, but not necessarily limited to, the following list. Additional legislative instruments such as regulations, codes and standards may exist under the legislation listed.

1. Building

**Administering Agency**
Department of Mines, Industry Regulation and Safety

**Relevant Legislation**
Building Services (Complaint Resolution and Administration) Act 2011
Building Services (Complaint Resolution and Administration) Regulations 2011
Building Service (Registration) Act 2011
Building Service (Registration) Regulations 2011

2. Caravan Parks and Camping Grounds

**Administering Agency**
Department of Local Government, Sport and Cultural Industries

**Relevant Legislation**
Caravan Park and Camping Grounds Act 1995
Caravan Park and Camping Grounds Regulations 1997

3. Child Care

**Administering Agency**
Department of Communities

**Relevant Legislation**
Child Care Services Act 2007
Child Care Services Regulations 2007
Child Care Services (Child Care) Regulations 2006

4. Fences

**Administering Agency**
Department of Mines, Industry Regulation and Safety

**Relevant Legislation**
Dividing Fences Act 1961

5. Health

**Administering Agency**
Department of Health
Relevant Legislation

Health Act (Miscellaneous Provisions) 1911
Health Act (Laundries & Bathrooms) Regulations
Health (Air Handling and Water Systems) Regulations 1994
Health (Asbestos) Regulations 1992
Health (Aquatic Facilities) Regulations 2007
Health (Construction Work) Regulations 1973
Construction Camp Regulations
Health (Public Buildings) Regulations 1992
Health (Treatment of Sewage and Disposal of Effluent and Liquid Waste) Regulations 1974
Health (Rottnest Island) By-laws 1989
Sewerage (Lighting, Ventilation and Construction) Regulations 1971
Health Local Laws where adopted by Local Government

6. Heritage

Administering Agency
Heritage Council of Western Australia

Relevant Legislation
Heritage of Western Australia Act 1990
Heritage of Western Australia Regulations 1991

7. Housing

Administering Agency
Department of Communities

Relevant Legislation
Housing Act 1980

8. Land

Administering Agency
Western Australian Land Information Authority

Relevant Legislation
Strata Titles Act 1985

9. Occupational Health and Safety

Administering Agency
Department of Mines, Industry Regulation and Safety

Relevant Legislation
Occupational Safety and Health Act 1984
10. Planning Controls

Administering Agency
Department of Planning, Land and Heritage

Relevant Legislation
Planning and Development Act 2005
Planning and Development (Consequential and Transitional Provisions) Act 2005

11. Public Works

Administering Agency
Department of Finance, Building Management and Works

Relevant Legislation
Public Works Act 1902

1.1 Introduction

This ABCB Housing Provisions contains *Deemed-to-Satisfy Provisions* that are considered to be acceptable forms of construction that meet the legislative requirements for complying with Parts H1 to H7 of NCC Volume Two (i.e. they comply with the *Performance Requirements* listed in Parts H1 to H7 of NCC Volume Two).

There is no obligation to adopt any particular option contained in this Housing Provisions if it is preferred to meet the *Performance Requirement* some other way.

However, if one of the options described in this Housing Provisions or elsewhere in the *Deemed-to-Satisfy Provisions* of NCC Volume Two is not complied with, then the appropriate authority must be satisfied that the *Performance Requirements* have been met.

1.2 Application

This Housing Provisions must be applied in accordance with each of the following:

- Section A (Governing Requirements) of NCC Volume Two.
- Any conditions on the use of the Housing Provisions set out within the *Deemed-to-Satisfy Provisions* of NCC Volume Two where it is referenced.
- The Scope clause at the beginning of each Section of this Housing Provisions.

1.3 The scope of the Housing Provisions

In Section H of NCC Volume Two, some *Deemed-to-Satisfy Provisions* contain more than one compliance pathway. Usually, the first of these pathways will be by referenced to a relevant Australian Standard (or similar) and the second will be by reference to a particular Section or Part of the ABCB Housing Provisions. In these cases, use of the Housing Provisions is one option for complying with the relevant *Deemed-to-Satisfy Provision*.

Other *Deemed-to-Satisfy Provisions* contain only one compliance pathway: either a reference to an Australian Standard (or similar), or a reference to a particular Section or Part of the ABCB Housing Provisions. In these cases, the ABCB Housing Provisions may only be used if it is referenced, and must be used if it is the only compliance option for the particular *Deemed-to-Satisfy Provision*.

If a *Deemed-to-Satisfy Provision* does not reference the ABCB Housing Provisions, then the Housing Provisions cannot be used as a compliance pathway for that particular *Deemed-to-Satisfy Provision*.

The ABCB Housing Provisions only contains content relevant to the *Deemed-to-Satisfy Provisions* in NCC Volume Two which call it up. Therefore, the ABCB Housing Provisions should not be interpreted as a comprehensive or complete manual for house building.

Section 2 of the ABCB Housing Provisions contains a number of structural design manuals which can be used to design building elements using engineering principles.

There is no obligation for the provisions of Section 2 to be used apart from situations where a particular building, building element or component is required to comply with NCC Volume Two and is not contained on the scope of any other *Deemed-to-Satisfy Provisions*.

Section 11 contains additional construction requirements that are ancillary to the construction of a building or structure, such as the construction of swimming pools, heating appliances, fireplaces, methods of attaching decks and balconies to external walls or the like. Section 11 also contains special provisions for construction in alpine areas (earthquake areas are addressed in Section 2, flood hazard areas are addressed in the ABCB Standard for Construction of Buildings in Flood Hazard Areas, which is referenced directly by H1D10).

Situations where it is necessary for a mixed application of the ABCB Housing Provisions and other standards referenced in the *Deemed-to-Satisfy Provisions* of NCC Volume Two may be identified by reference to the differing components of the *Performance Requirements* (see A2G3).
1.4 Suitability of Performance Solutions

The options described in the Deemed-to-Satisfy Provisions are typical examples of national construction methods. They are certainly not the only means available of complying with NCC Volume Two. The performance format of the NCC provides flexibility and allows the use of alternative construction methods to those described in the Deemed-to-Satisfy Provisions.

1.5 The use of maps

Maps have been used throughout NCC Volume Two, including in the ABCB Housing Provisions, to indicate areas where particular requirements apply. These maps are indicative and some variation in conditions will apply, especially on the border of marked areas.

It is recommended that the appropriate authority be consulted and in most cases they be able to identify what conditions apply in such areas at the early stage of building design.

1.6 Consultation with appropriate authorities

When building in certain locations there may be local conditions or other site constraints that may limit the type of construction that can be used. This is particularly important with buildings that are constructed in areas subject to increased structural loading conditions that may occur due to geographical, topographical or climatic conditions and soil types.

Appropriate authorities have a wide range of experience and information on the geographical and topographical conditions found in their area of responsibility, and should be consulted during the initial design stage.

1.7 Layout of the ABCB Housing Provisions

Although it does not cover every aspect of housing construction, the ABCB Housing Provisions has nonetheless been organised in a manner that follows the logical construction sequence of a building. Table 1.7 outlines some of the more frequently used details and where they are located in the ABCB Housing Provisions.

1.8 Interpretation
Throughout the ABCB Housing Provisions, diagrams, explanatory information and cross-volume considerations are included. A1G1 (interpretation) contains information on these elements in the NCC which is also applicable when they appear in the ABCB Housing Provisions.

1.9 How to use the requirements of each Section/Part
Each Section of the ABCB Housing Provisions is comprised of a scope statement and one or more Parts which contain the technical provisions which must be followed as appropriate to achieve compliance with the relevant Deemed-to-Satisfy Provision. Generally, a Deemed-to-Satisfy Provision will refer to a specific Part of the ABCB Housing Provisions in order to link the user directly to the relevant technical provisions.

Each Section contains a scope and application Part which sets out the conditions and limitation applicable to the subsequent Parts contained within that Section. Each Part must only be applied in a way that is consistent with its scope.

Sections are numbered with a single numeral (e.g. Section 2 - Structure).

Parts are numbered with two numbers separated by a decimal (e.g. Part 2.2 – Structural provisions).

Clauses within each Part are numbered with three numbers separated by a decimal point (e.g. Clause 2.2.4 – Determination of structural resistance of materials and forms of construction).

Subclauses and below are numbered using the system used throughout the NCC.

2 Structure

Part 2.1 Scope and application of Section 2

2.1.1 Scope
2.1.2 Application

Part 2.2 Structural provisions

2.2.1 Application of Part 2.2
2.2.2 Resistance to actions
2.2.3 Determination of individual actions
2.2.4 Determination of structural resistance of materials and forms of construction
2.2.5 Structural software
2.1.1 Scope

(1) This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for structure (see Part 2.2).

(2) For other structural provisions not included in this Section of the ABCB Housing Provisions, refer to the following Deemed-to-Satisfy Provisions in NCC Volume Two:
   (a) Site preparation (see H1D3).
   (b) Footings and slabs (see H1D4).
   (c) Masonry (see H1D5).
   (d) Framing (see H1D6).
   (e) Roof and wall cladding (see H1D7).
   (f) Glazing (see H1D8).
   (g) Earthquake areas (see H1D9).
   (h) Flood hazard areas (see H1D10).
   (i) Attachment of decks and balconies to external walls of buildings (see H1D11).

2.1.2 Application

The application of Section 2 of the ABCB Housing Provisions is subject to the following:

   (a) The Governing Requirements of NCC 2022 Volume Two.
   (b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:

In NCC 2019, the content of Section 2 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in Part 3.0 of NCC Volume Two.
2.2.1 Application of Part 2.2

[New for 2022]

Part 2.2 need not be complied with if, for the purposes of H1D2(1)(b) only, the Deemed-to-Satisfy Provisions of H1D3 to H1D11 relating to structural elements are complied with.

2.2.2 Resistance to actions

[2019: 3.0.2]

The resistance of a building or structure must be greater than the most critical action effect resulting from different combinations of actions, where—

(a) the most critical action effect on a building or structure must be determined in accordance with 2.2.3 and the general design procedures contained in AS/NZS 1170.0; and

(b) the resistance of a building or structure is determined in accordance with 2.2.4.

Explanatory Information:
A building or structure must be designed to resist the most critical effect resulting from different combinations of actions, taking into consideration—

(a) the probability of simultaneous occurrence of two or more actions; and

(b) the levels of reliability of the structure when subject to combined actions; and

(c) the characteristics of the action.

Determining the levels of reliability of the structure when subject to combined actions should be consistent with the levels of reliability implicit in the design events for natural phenomenon. When designing for the maximum combined actions, a principle frequently adopted is that the maximum is likely to occur when at least one of the actions is at its maximum value.

NT 2.2.3

2.2.3 Determination of individual actions

[2019: 3.0.3]

The magnitude of individual actions must be determined in accordance with the following:

(a) Permanent actions:
   (i) the design or known dimensions of the building or structure; and
   (ii) the unit weight of the construction; and
   (iii) AS/NZS 1170.1.

(b) Imposed actions:
   (i) the known loads that will be imposed during the occupation or use of the building or structure; and
   (ii) construction activity actions; and
   (iii) AS/NZS 1170.1.

(c) Wind, snow and earthquake actions:
   (i) the applicable annual probability of design event for safety, determined by—
      (A) assigning the building or structure an Importance Level in accordance with Table 2.2.3a; and
(B) determining the corresponding annual probability of exceedance for safety in accordance with Table 2.2.3b; and

(ii) for wind actions, AS/NZS 1170.2 or AS 4055; and
(iii) for snow and ice actions, AS/NZS 1170.3; and
(iv) for earthquake actions, AS 1170.4.

(d) Actions not covered in (a), (b) and (c) above:

(i) the nature of the action; and
(ii) the nature of the building or structure; and
(iii) the Importance Level of the building or structure determined in accordance with Table 2.2.3a; and
(iv) AS/NZS 1170.1.

(e) For the purposes of (d) the actions include but are not limited to—

(i) liquid pressure action; and
(ii) ground water action; and
(iii) rainwater action (including ponding action); and
(iv) earth pressure action; and
(v) differential movement; and
(vi) time dependent effects (including creep and shrinkage); and
(vii) thermal effects; and
(viii) ground movement caused by—
   (A) swelling, shrinkage or freezing of the subsoil; and
   (B) landslip or subsidence; and
   (C) siteworks associated with the building or structure; and

(ix) construction activity actions.

</tr>
</tbody>
</table>
Explanatory Information: Permanent and imposed actions

Permanent actions include the dead loads of the building or structure. These include the load imposed by the building’s components inclusive of the forces imposed by the floors, walls, roofs, suspended ceilings, etc.

Imposed actions include live loads on the building or structure. These include the load arising from construction activity and the intended use or function of the building or structure.

Explanatory Information: Application of AS 1170.4

There are certain limitations on the application to domestic structures such as Class 1a and Class 1b buildings in Appendix A of AS 1170.4. These limitations include building height, roof slope, etc. For additional information refer to Appendix A of AS 1170.4.

Explanatory Information: Importance Levels (Table 2.2.3a)

Table 2.2.3a provides a generic description of building types to which Importance Levels have been assigned. The “Importance Level” concept is applicable to building structural safety only. More specific examples are provided in the following list. The examples are indicative and not exhaustive.

- Importance Level 1: Isolated minor Class 10a buildings and Class 10b structures.
- Importance Level 2: Class 1 buildings; Class 10a buildings and Class 10b structures associated with Class 1 buildings.

Importance Levels must be assigned on a case by case basis and relate to the hazards to human life and other property in the event of the structure’s failure. For example—

(a) Importance Level 1 is for minor isolated structures that rarely contain people, are not required as part of normal infrastructure and present a low risk to life and other property.

(b) Importance Level 2 includes domestic housing and structures intended to contain reasonable numbers of people under normal operations.
Explanatory Information: Construction in cyclonic areas

The intent of building construction in cyclonic areas (see Figure 2.2.3) is to ensure the structure has sufficient strength to transfer wind forces to the ground with an adequate safety margin to prevent collapse of the building and the building being lifted, or slid off its foundations.

To resist these forces it is necessary to have—

(a) an anchorage system, where the roof is connected by the walls to the footings by a chain of connections; and
(b) a bracing system to prevent horizontal collapse due to wind forces; and
(c) continuity of the system where each structural element is interlocked to its adjoining structural element throughout the building.

Explanatory Information: Anchorage

Anchorage of the system is achieved by using a variety of connectors. Each connector must be capable of carrying the uplift force, because the ability of the building to resist the wind forces is directly related to its weakest link.

2.2.4 Determination of structural resistance of materials and forms of construction

[2019: 3.0.4]

The following requirements, or any combination of them, must be used to determine the structural resistance of materials and forms of construction as appropriate:

(a) Earthworks: H1D3(1).
(b) Earth retaining structures: H1D3(2).
(c) Termite risk management: H1D3(3).
(d) Concrete construction (including slabs and footings, piled footings and reinforced and prestressed concrete structures): H1D4 or AS 3600 as applicable.
(e) Post-installed and cast-in fastenings in concrete: AS 5216.
(f) Masonry (including masonry veneer, unreinforced masonry and reinforced masonry): H1D5.
(g) Steel construction (including steel framing and structural steel members): H1D6(2), (4) and (5).
(h) Timber construction (including design of timber structures, timber framing and design of nail-plated timber roof trusses): H1D6(3).
(i) Composite steel and concrete: AS/NZS 2327.
(j) Aluminium construction:
   (i) AS/NZS 1664.1.
   (ii) AS/NZS 1664.2.
(k) Roof construction (including plastic sheeting, roofing tiles, metal roofing and terracotta, fibre-cement and timber slates and shingles): H1D7.
(l) Wall cladding: H1D7.
(m) Glazed assemblies: H1D8.
(n) Barriers and handrails (including stairway and ramp construction):
   (i) H5D3; and
   (ii) AS/NZS 1170.1 for the determination of loading forces on a barrier.
(o) Attachment of decks and balconies to external walls of buildings: H1D11.
(p) Garage doors and other large access doors in openings not more than 3 m in height in external walls of buildings determined as being located in wind region C or D in accordance with Figure 2.2.3: AS/NZS 4505.
(q) For high wind areas: requirements listed in (a) to (p) as appropriate or the Northern Territory Deemed to Comply Standards Manual.
Explanatory Information:
The weight of roof or ceiling insulation, particularly if additional ceiling insulation is used for compliance with the energy efficiency provisions, needs to be considered in the selection of plasterboard, plasterboard fixings and building framing.

2.2.5 Structural software

(1) Structural software used in computer aided design of a building or structure that uses design criteria based on the Deemed-to-Satisfy Provisions of the Housing Provisions, including its referenced documents, for the design of steel or timber trussed roof and floor systems and framed building systems, must comply with the ABCB Protocol for Structural Software.

(2) The requirements of (1) only apply to structural software used to design steel or timber trussed roof and floor systems and framed building systems for buildings within the following geometrical limits:

- The distance from ground level to the underside of eaves must not exceed 6 m.
- The distance from ground level to the highest point of the roof, neglecting chimneys, must not exceed 8.5 m.
- The building width including roofed verandahs, excluding eaves, must not exceed 16 m.
- The building length must not exceed five times the building width.
- The roof pitch must not exceed 35 degrees.

(3) The requirements of (1) do not apply to design software for individual frame members such as electronic tables similar to those provided in—

- AS 1684 Parts 2, 3 and 4; or
- NASH Standard Residential and Low-Rise Steel Framing, Part 2.

Explanatory Information:
2.2.5 does not apply where a software package simply eliminates manual calculations and the process of the package requires identical methodology as that undertaken manually, e.g. AS 1684 span tables and bracing calculations.
3 Site preparation

Part 3.1 Scope and application of Section 3
3.1.1 Scope
3.1.2 Application

Part 3.2 Earthworks
3.2.1 Un-retained bulk earthworks – site cut and fill

Part 3.3 Drainage
3.3.1 Application of Part 3.3
3.3.2 Drainage requirements
3.3.3 Surface water drainage
3.3.4 Subsoil drainage
3.3.5 Stormwater drainage

Part 3.4 Termite risk management
3.4.1 Requirements for termite management systems
3.4.2 Termite management systems
3.4.3 Durable notice
3.1.1 Scope

(1) This Section of the ABCB Housing Provisions sets out the *Deemed-to-Satisfy Provisions* for—
   (a) Earthworks (see Part 3.2); and
   (b) Drainage (see Part 3.3); and
   (c) Termite risk management (see Part 3.4).

(2) For other site preparation provisions not included in this Section of the ABCB Housing Provisions, refer to the following *Deemed-to-Satisfy Provisions* in NCC Volume Two: Earth retaining structures (see H1D3(2)).

**Explanatory Information:**
These provisions relate to general *site* preparation for footings, services, drainage and installation of termite management systems. It should be noted that other construction methods may be used to achieve the same results as specified in this Part provided they comply with the appropriate *Performance Requirement*.

The provisions in Part 3.2 will enable earthworks associated with the construction of a building to be carried out safely and to avoid potential damage to the subject building, adjoining structures and property through the soil collapsing or subsiding. Exceptional *site* conditions (including the effects of torrential rain) may need special consideration and additional advice from appropriately qualified people should be considered.

State and Territory legislation may also have requirements that apply to earthworks, especially in relation to adjoining property and notification of owners of that property. Advice should be obtained from the appropriate authority before commencement of works.

The requirements of this Part are to be read in conjunction with H1D3(2) where an earth retaining structure is installed.

3.1.2 Application

The application of Section 3 of the ABCB Housing Provisions is subject to the following:

(a) The Governing Requirements of NCC 2022 Volume Two.

(b) Any conditions set out within the following *Deemed-to-Satisfy Provisions* of NCC Volume Two:
   (i) H1D3(1), for earthworks.
   (ii) H2D4(1)(b), for drainage.

(c) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

**Explanatory Information:**
In NCC 2019, the content of Section 3 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.1.1, 3.1.3 and 3.1.4 of NCC 2019 Volume Two.

NCC 2019 Volume Two did not include an acceptable construction practice for Part 3.1.2.
3.2.1 Un-retained bulk earthworks – site cut and fill

[2019: 3.1.1]

(1) A site cut using an un-retained embankment must be—
   (a) within the allotment; and
   (b) not within the zone of influence of any existing structure on the property, or the allotment boundary as defined in Table 3.2.1 and Figure 3.2.1a; and
   (c) not deeper than 2 m from the natural ground level at any point.

(2) Fill, using an un-retained embankment must—
   (a) be placed within the allotment; and
   (b) be placed at a gradient which complies with Table 3.2.1 and Figure 3.2.1b; and
   (c) be placed and mechanically compacted in layers not more than 150 mm; and
   (d) be not more than 2 m in height from the natural ground level at any point; and
   (e) where used to support footings or slabs, be placed and compacted in accordance with Part 4.2; and
   (f) have surface water diverted away from any existing structure on the property or adjoining allotment in accordance with 3.3.3.

Table 3.2.1: Un-retained embankment slope ratios

<table>
<thead>
<tr>
<th>Soil class (see 4.4.1 for material description)</th>
<th>Site cut (excavation) (maximum embankment slope ratio, angle of site cut $H:L$ Note 1)</th>
<th>Compacted fill (maximum embankment slope ratio, angle of batter $H:L$ Note 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stable rock (Class A)</td>
<td>8:1</td>
<td>3:3</td>
</tr>
<tr>
<td>Sand (Class A)</td>
<td>1:2</td>
<td>1:2</td>
</tr>
<tr>
<td>Firm clay (Class M-E)</td>
<td>1:1</td>
<td>1:2</td>
</tr>
<tr>
<td>Soft clay (Class M-E)</td>
<td>2:3</td>
<td>Not suitable</td>
</tr>
</tbody>
</table>

Table Notes:
1. See Figures 3.2.1a and 3.2.1b for some examples of un-retained embankment slopes.
2. Retaining walls must be installed in accordance with H1D3(2) where—
   a. the embankment slope is steeper than described in this Table; or
   b. the soil type is not described in this Table.
Figure 3.2.1a: Site cut and fill using un-retained embankments — Site cut commencing at the allotment boundary or affecting an adjoining property

Figure Notes:

1. The angle for line A-A is defined as the maximum embankment slope ratio H:L in Table 3.2.1 and is taken from the bottom of the existing footing and is defined as the area suitable for excavation.

2. Consideration must be given for drainage of surface water, particularly where fill affects an adjoining property.
Figure 3.2.1b: Site cut and fill using un-retained embankments — Fill commencing at the allotment boundary or affecting an adjoining property

Figure Notes:
1. The angle for line A-A is defined as the maximum embankment slope ratio H:L in Table 3.2.1 and is taken from the bottom of the existing footing and is defined as the area suitable for excavation.
2. Consideration must be given for drainage of surface water, particularly where fill affects an adjoining property.
3.3.1 Application of Part 3.3

(1) Part 3.3 is subject to the limitations set out in H2D2(1)(b).

(2) Part 3.3 need not be complied with if H2D2(1)(a) is complied with.

3.3.2 Drainage requirements

Drainage systems must be installed as follows—

(a) areas adjoining and under buildings — *surface water* drainage in accordance with 3.3.3; and

(b) where *site* conditions exist that create a need for subsoil water to be diverted away from footings, basements, retaining walls etc — sub-soil drainage in accordance with 3.3.4; and

(c) where underground drainage from roof areas is *required* or permitted — underground stormwater drainage in accordance with 3.3.5; and

(d) excavation for drains adjacent to existing footings must be within the area described in Figure 3.3.2 as being safe for excavation.

**Figure 3.3.2: Excavation for drains adjacent to footings**

Figures Notes:

1. Any excavation below the area defined as being safe for excavation will need additional protection measures to be determined by appropriately qualified persons.

2. Slope ratio H:L is determined using Table 3.2.1.
3.3.3 Surface water drainage

Surface water must be diverted away from Class 1 buildings as follows:

(a) Slab-on-ground — finished ground level adjacent to buildings: the external finished surface surrounding the slab must be drained to move surface water away from the building and graded to give a slope of not less than (see Figure 3.2.1) —
   (i) 25 mm over the first 1 m from the building in low rainfall intensity areas for surfaces that are reasonably impermeable (such as concrete or clay paving); or
   (ii) 50 mm over the first 1 m from the building in any other case.

(b) Slab-on-ground — finished slab heights: the height of the slab-on-ground above external finished surfaces must be not less than (see Figure 3.3.3a) —
   (i) 100 mm above the finished ground level in low rainfall intensity areas or sandy, well-drained areas; or
   (ii) 50 mm above impermeable (paved or concrete) areas that slope away from the building in accordance with (a); or
   (iii) 150 mm in any other case.

(c) The ground beneath suspended floors must be graded so that the area beneath the building is above the adjacent external finished ground level and surface water is prevented from ponding under the building (see Figure 3.3.3b).

Figure 3.3.3a: Site surface drainage

Figure Notes:
1. For fall in finished external surface, see 3.3.3(a).
2. For finished floor level above finished external surface, see 3.3.3(b).
Figure 3.3.3b: Grading of ground under suspended floors

Explanatory Information:
The appropriate slab height above finished ground level and the slope of the external finished surface surrounding the slab may vary depending on:

(a) The local plumbing requirements; in particular the height of the overflow relief gully relative to drainage fittings and ground level (to work effectively they must be a minimum of 150 mm below the lowest sanitary fixture).

(b) The run-off from storms, particularly in areas of high rainfall intensity, and the local topography.

(c) The effect of excavation on a cut and fill site.

(d) The possibility of flooding.

(e) Termite risk management provisions.

Clearances between wall cladding and the finished ground level are provided in 7.5.7.

3.3.4 Subsoil drainage

Where a subsoil drainage system is installed to divert subsurface water away from the area beneath a building, the subsoil drain must—

(a) be graded with a uniform fall of not less than 1:300; and

(b) discharge into an external silt pit or sump with—

(i) the level of discharge from the silt pit or sump into an impervious drainage line not less than 50 mm below the invert level of the inlet (see Figure 3.3.4); and

(ii) provision for cleaning and maintenance.
Explanatory Information:
Subsoil drainage systems may need to be installed where subsurface water movement could damage buildings or cause loss of amenity through the build up of excessive moisture or lateral water pressure. Typical locations of subsoil drainage systems are on the uphill side of cut and fill sites, adjacent to deep footings, behind retaining walls and adjacent to basement walls.

The design and installation of subsoil drainage systems should take into account the nature of the soil and the anticipated water level, quantity and movement. In some cases, detailed investigations involving excavations, field observations and soil tests may be necessary to determine the appropriate solution. Typical subsoil drain configurations are shown in the following diagrams.

In clay soil, subsoil drains can alter the long-term moisture content in the soil, adversely affecting the building foundation by removing or, in some cases, introducing water. In such conditions, subsoil drains should only be used where there are no other options for dealing with subsoil water.

Additional guidance on subsoil drainage systems can be found in AS/NZS 3500.3 and AS 2870.
Figure 3.3.4 (explanatory): Typical subsoil drain configurations

3.3.5 Stormwater drainage

Where a stormwater drainage system is installed, it must comply with the following:

(a) The position and manner of discharge of the stormwater drainage system must be to the satisfaction of the appropriate authority.

(b) The stormwater drainage system must be designed so that any overflow during heavy rain periods is prevented from flowing back into the building.

(c) Cover to stormwater drains: the cover to 90 mm Class 6 UPVC stormwater drains installed underground must be not less than—

(i) under soil — 100 mm; or
(ii) under paved or concrete areas — 50 mm; or
(iii) under areas subject to light vehicle traffic—

(A) reinforced concrete — 75 mm; or
(B) paved — 100 mm.

Explanatory Information: Discharge points

The manner of discharge of stormwater drainage systems includes consideration of discharge points. Some examples of discharge points which may be acceptable to the appropriate authority are:

(a) A legal discharge point at the allotment boundary.
(b) On-site catchment systems, such as stormwater tanks.
(c) On-site soil drainage systems, such as soaker wells.
Explanatory Information: Depth of cover
Different depths of soil cover (or no cover at all) can be achieved using other types of pipes. The cover specified is measured from the top of the pipe to either the finished ground level or, in the case of paved or concreted areas, to the underside of the paving or concrete.
Part 3.4 Termite risk management

3.4.1 Requirements for termite management systems

(1) The requirements of this Part apply where:

(a) a Class 1 or 10 building is constructed in an area where subterranean termites are known to present a potential risk of attack; and

(b) a part of a Class 1 or 10 building is considered susceptible to termite attack.

NT 3.4.1(2)

(2) For the purposes of (1), a part consisting entirely of, or a combination of, any of the following materials is considered not subject to termite attack:

(a) Steel, aluminium or other metals.

(b) Concrete.

(c) Masonry.

(d) Fibre-reinforced cement.

(e) Timber — naturally termite resistant in accordance with Appendix C of AS 3660.1.

(f) Timber — preservative treated in accordance with Appendix D of AS 3660.1.

QLD 3.4.1(3)
QLD 3.4.1(4)
QLD 3.4.1(5)
QLD 3.4.1(6)

Explanatory Information:

1. 3.4.1(1): Termites are not considered to be a risk in Tasmania and a lesser risk in parts of Victoria. The appropriate authority may have records of termite activity for each area and may be able to advise on whether termite risk management is needed.

2. 3.4.1(2): Where individual parts are susceptible to termite attack and the remainder of the building are constructed of termite resistant materials, only the susceptible elements need to be provided with a termite management system.

3. 3.4.1(2)(c): states that masonry is not subject to termite attack, however termites may gain entry through mortar and other joints.

4. Explanatory Figure 3.4.1 provides a flowchart for identifying if a termite management system is required.
Figure 3.4.1 (explanatory): Flow chart for identifying if a termite management system is required

- **IS THE BUILDING IN A TERMITE RISK AREA?** (ask your appropriate authority)
- **ARE THE PRIMARY BUILDING ELEMENTS SUBJECT TO TERMITE ATTACK?** (check primary building elements)
- **INSTALL APPROPRIATE TERMITE MANAGEMENT SYSTEM**

**Figure Notes:**
To check *primary building elements*, see 3.4.1(2).

**NT 3.4.2**
**QLD 3.4.2**

**3.4.2 Termite management systems**

Where a termite management system is required it must—

(a) be selected appropriate to Table 3.4.2; and

(b) comply with—

(i) AS 3660.1; or

(ii) have been tested and passed the tests **required** by Section 5 of AS 3660.3; and

(c) have a durable notice installed in accordance with 3.4.3; and

(d) where a chemical termite management system is used, the chemical must be included on the appropriate authority’s pesticides register.

**Table 3.4.2:** Acceptable termite management systems and components

<table>
<thead>
<tr>
<th>Building element</th>
<th>Termite management system or component options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concrete slab-on-ground: slab perimeter or <strong>external wall</strong> perimeter</td>
<td>Slab edge exposure</td>
</tr>
<tr>
<td></td>
<td>Sheet material</td>
</tr>
<tr>
<td></td>
<td>Granular material</td>
</tr>
</tbody>
</table>
Table Notes:
The entire area beneath the slab must be treated when the slab-on-ground is not designed and constructed in accordance with AS 2870 or AS 3600.

Explanatory Information: Validity of test results
3.4.2(b)(ii) provides the option of having a chemical termite management system tested to AS 3660.3. In order for the test results to remain valid, the system would then have to be installed as tested.

Explanatory Information: Component
A component of a system as referred to in Table 3.4.2 is one that when used in combination with other components, will form a “full system”.

For example, if a concrete slab is used as a component of a system, it in itself will not provide a complete termite management system. Depending on the construction methods and the site conditions, additional requirements will be necessary for service penetrations through the concrete slab. Each of these are “components”, when integrated, will form a “full system”.

Explanatory Information: Integrity of the termite management system
There are more than 350 species of termites in Australia, about 30 of which achieve economic importance by causing costly damage to building structures. Due to the nature of termites, it is extremely difficult to prevent them gaining access to a building.

In addition to correct installation of a termite management system, its effectiveness will rely on regular maintenance and competent inspection.

Explanatory Information: Attachments to buildings
Attachments referred to in Table 3.4.2 include downpipes, service pipes, steps, verandahs, porches, access ramps, carports, trellises, decks, heated water systems, air-conditioners and the like.

3.4.3 Durable notice

A durable notice must be permanently fixed to the building in a prominent location, such as in a meter box or the like, indicating—

(a) the termite management system used; and
(b) the date of installation of the system; and
(c) where a chemical is used, its life expectancy as listed on the appropriate authority’s register label; and
(d) the installer’s or manufacturer’s recommendations for the scope and frequency of future inspections of termite activity.
Explanatory Information: Appropriate authority
For the purpose of the pesticides register, the appropriate authority is the government body responsible for the registration of pesticides. Currently, the Australian Pesticides and Veterinary Medicines Authority (APMVA) coordinates the registration scheme.

Explanatory Information: Durable notice
Where a durable notice is required by 3.4.3 a durable notice must be fixed to the building in a prominent location advising the building occupants that the system should be inspected and maintained.

The notice should be clearly written, on a material that will not deteriorate or fade over time and be located in or near the electrical meter box or similar location so that it can be easily seen and read by future owners of the building. Additional information may be included if desired by the person placing the notice.

Part 4.1 Scope and application of Section 4

4.1.1 Scope

This Section of the ABCB Housing Provisions sets out the *Deemed-to-Satisfy Provisions* for footings and slabs.

**Explanatory Information:**

This Section specifies the requirements for the excavation and filling for the footing or slab together with the construction of various alternative concrete slab and footing configurations. The slab and footing configurations detailed in this Part are only suitable for the specified soil classifications. The requirements contained in the remainder of this Section are more general and may be applied to all slab and footing construction.

The requirements of this Section are to be read in conjunction with Part 6.2. The Part 6.2 subfloor ventilation requirements apply to the subfloor space of all suspended floors of a building or deck, including but not limited to, timber and steel-framed subfloors and suspended concrete slabs.

4.1.2 Application

The application of Section 4 of the ABCB Housing Provisions is subject to the following:

(a) The Governing Requirements of NCC 2022 Volume Two.

(b) Any conditions set out within the following *Deemed-to-Satisfy Provisions* of NCC Volume Two: H1D4(2), for footings and slabs.

(c) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

**Explanatory Information:**

In NCC 2019, the content of Section 4 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Part 3.2 of NCC 2019 Volume Two.

4.1.3 Explanation of terms

Figures 4.1.3a, 4.1.3b and 4.1.3c depict footing and slab members and associated terminology used to describe them in Part 4.2 of the ABCB Housing Provisions.
**Figure 4.1.3a:** Footing and slab members and associated terminology: diagram 1

Figure Notes:
1. Controlled fill.
2. Deepened edge beam and slab.
3. Natural ground line above cut.
5. Foundation (natural ground below fill).
Part 4.2 Preparation Footings, slabs and associated elements

4.2.1 Application of Part 4.2

Part 4.2 is subject to the limitations set out in H1D4(2).

4.2.2 Site classification

The foundations where footings and slabs are to be located must be classified in accordance with AS 2870.

Explanatory Information:
Explanatory Table 4.2.2 provides a general description of foundation soil types that will assist in the classification of a site. More detailed information, including differentiation between classifications, can be found in AS 2870 or alternatively contact the appropriate authority.

Due to the limitations of this Part, if a site is classified H, E or P then reference must be made to AS 2870 for design and construction information.

Table 4.2.2 (explanatory): General definition of site classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Foundation</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Most sand and rock sites with little or no ground movement from moisture changes</td>
</tr>
<tr>
<td>S</td>
<td>Slightly reactive clay sites with only slight ground movement from moisture changes</td>
</tr>
<tr>
<td>M</td>
<td>Moderately reactive clay or silt sites which can experience moderate ground movement from moisture changes</td>
</tr>
<tr>
<td>H</td>
<td>Highly reactive clay sites which can experience high ground movement from moisture changes</td>
</tr>
<tr>
<td>E</td>
<td>Extremely reactive clay sites which can experience extreme ground movement from moisture changes</td>
</tr>
<tr>
<td>A to P</td>
<td>Filled sites — see AS 2870</td>
</tr>
<tr>
<td>P</td>
<td>Sites which include soft soils, such as soft clay or silt or loose sands; landslip; mine subsidence; collapsing soils; soils subject to erosion; reactive sites subject to abnormal moisture conditions or sites which cannot be classified otherwise.</td>
</tr>
</tbody>
</table>

Table Notes:
1. For Class M, further division based on the depth of expected movement is required.
2. For deep-seated movement, characteristic of dry climates and corresponding to a design depth of suction change $H_{SL}$ equal to or greater than 3 m, the classification must be M-D.
3. If classification M-D is established due to further division, design of footings and slabs is beyond the scope of the ABCB Housing Provisions and reference must be made to AS 2870 for design and construction information.
4.2.23 Excavation for footings

(1) Excavation for footings, including thickenings for slabs and pads must be clean cut with vertical sides, wherever possible.

(2) The base of the excavation must be—
   (a) for flat sites, generally level but may slope not more than 1:40 to allow excavations to drain; and
   (b) sloping sites at an angle of not more than 1:10; and
   (c) stepped footings in accordance with 4.2.7.6.

(3) Footing excavations must be free of loose earth, tree roots, mud or debris immediately before pouring concrete.

(4) Topsoil containing grass roots must be removed from the area on which the footing will rest site of the foundation.

(5) Excavation depths and soil cuts must comply with Part 3.2.

(6) On loose sand sites subject to wind or water erosion, the depth below finished ground level for to the bottom of footings must be not less than 300 mm.

(7) Height of finished slab-on-ground must be in accordance with 3.3.3(b).

4.2.34 Filling under concrete slabs

Filling placed under a slab (except where the slab is suspended) must comply with the following:

(a) Filling must be either controlled fill or rolled fill as follows:
   (i) Sand used in controlled fill or rolled fill must not contain any gravel size material and achieve a blow count of 7 or more per 300 mm using the test method described in AS 1289.6.3.3.
   (ii) Clay used in controlled fill or rolled fill must be moist during compaction.
   (iii) Controlled fill:
      (A) Sand fill up to 800 mm deep — well compacted in layers not more than 300 mm deep by vibrating plate or vibrating roller.
      (B) Clay fill up to 400 mm deep — well compacted in layers of not more than 150 mm by a mechanical roller.
   (iv) Rolled fill:
      (A) Sand fill up to 600 mm deep — compacted in layers of not more than 300 mm by repeated rolling by an excavator or other suitable mechanical equipment.
      (B) Clay fill up to 300 mm deep — compacted in layers of not more than 150 mm by repeated rolling by an excavator or similar machine.

(b) A level layer of clean quarry sand must be placed on top of the fill, with a depth of not less than 20 mm.

(c) A graded stone termite management system complying with Part 3.4 may be substituted for the sand required in (b).

(d) Where perimeter walls retain the controlled fill or rolled fill, the walls must be able to resist the lateral pressures from compacted soil and the compaction equipment activity.

4.2.45 Foundations for footings and slabs

Footings and slabs, including internal and edge beams, must be founded on soil with an allowable bearing pressure as follows:

(a) Slab panels, load support panels and internal beams — natural soil with an allowable bearing pressure of not less than 50 kPa or controlled fill or rolled fill compacted in accordance with 4.2.34.2.4.
(b) Edge beams connected to the slab — natural soil with an allowable bearing pressure of not less than 50 kPa or controlled fill compacted in accordance with 4.2.3(a)(iii) and extending past the perimeter of the building 1 m with a slope ratio not steeper than 2 horizontal to 1 vertical (see Figure 4.2.4 and Figure 4.2.5).

(c) Pad footings, strip footings and edge beams not connected to the slab, must be—

(i) founded in natural soil with an allowable bearing pressure of not less than 100 kPa; or

(ii) for Class A and S sites they may be founded on controlled sand fill in accordance with 4.2.3(a) and 4.2.4(a).

Figure 4.2.45: Foundations for footings and slabs

Explanatory Information:

The foundations of a building are critical to its successful performance. As such, the soil must have the strength or bearing capacity to carry the building load with minimum movement.

The bearing capacity of a soil varies considerably and needs to be determined on a site by site basis. For this to occur, the appropriate people need to be consulted. These people may include a qualified engineer or experienced engineering geologist, or it may be determined by a person with appropriate local knowledge. The minimum bearing capacity (soil strength rating) may depend on the site conditions. The soil may be naturally undisturbed or be disturbed by building work or the like. Where soil is disturbed by building work and the like, the bearing capacity can be dramatically altered. This is typically the case for sloping sites where cut and fill procedures are used. In these situations the soil needs to be consolidated, generally via compaction, to achieve the required bearing capacity.

There are a number of alternatives for working on cut and filled sites. These are described in Figure 4.2.4 and Figure 4.2.5. Option 1 of Figure 4.2.4 and Figure 4.2.5 refers to the controlled fill process which involves the compaction of fill in layers to achieve the bearing capacity described in Figure 4.2.4 and Figure 4.2.5. The depth of fill for each layer is specified to ensure effective compaction. Fill beyond these depths will need to be installed in accordance with H1D4(1).

Option 2 and 3 of Figure 4.2.4 and Figure 4.2.5 refer to edge beams that extend through the fill into undisturbed soil which...
Footings and slabs installed on the low side of sloping sites must be as follows:

(a) Slab panels — in accordance with 4.2.4(a) 4.2.5(a).
(b) Edge beams—
   (i) supported by controlled fill in accordance with 4.2.4(b) 4.2.5(b) (see Figure 4.2.5, Option 1); or
   (ii) supported by deepened edge beams or bulk piers designed in accordance with AS 3600 (see Figure 4.2.4, Option 2); or
   (iii) deepened (as per AS 2870) to extend into the natural soil level with a bearing capacity in accordance with 4.2.4(b) 4.2.5(b) (see Figure 4.2.4, Option 3); or
   (iv) stepped in accordance with AS 2870.
(c) Edge beams not connected to the slab, pad footings and strip footings — founded in accordance with 4.2.4(c) 4.2.5(c).
(d) Where an excavation (cut) of the natural ground is used it must be in accordance with Part 3.2.

Stepped strip footings must be constructed as follows—

(a) the base of the footing must be horizontal or have a slope of not more than 1:10; or
(b) be stepped in accordance with one of the methods shown in Figure 4.2.6, Figure 4.2.7.

Figure Notes:
All dimensions in millimetres.
Vapour barriers

(1) A vapour barrier must be installed under slab-on-ground construction for all Class 1 buildings and for Class 10 buildings where the slab is continuous with the slab of a Class 1 building in accordance with (2), (3), (4) and (5).

(2) Materials: A vapour barrier must be—
   (a) 0.2 mm nominal thickness polyethylene film; and
   (b) medium impact resistant,
   determined in accordance with criteria specified in clause 5.3.3.3 of AS 2870.

(3) A vapour barrier must be branded continuously “AS 2870 Concrete underlay, 0.2 mm Medium impact resistance”.

(3) Installation: A vapour barrier must be installed as follows—
   (a) lap not less than 200 mm at all joints; and
   (b) tape or seal with a close fitting sleeve around all service penetrations; and
   (c) fully seal where punctured (unless for service penetrations) with additional polyethylene film and tape.

(4) The vapour barrier must be placed beneath the slab so that the bottom surface of the slab is entirely underlaid and extends under internal and edge beams to finish at ground level in accordance with Figure 4.2.7 and Figure 4.2.8.

Figure 4.2.7: Acceptable vapour barrier and damp-proofing membrane location

(a) Minimum rebate for cavity masonry or veneer wall

(b) Deep edge rebate alternative

(c) Masonry alternative

Figure Notes:
All dimensions in millimetres.
4.2.89  Edge rebates

Edge rebates for slab-on-ground, and stiffened raft or waffle raft with masonry cavity or veneer construction must comply with the following:

(a) The rebate must not be less than 20 mm, except as provided for in (d).
(b) Exterior masonry must not overhang more than 15 mm past the edge of the slab.
(c) The edge rebate must be flashed and drained in accordance with H2D4 and where it cannot be flashed it must be filled with mortar.
(d) Edge rebates are not required for single leaf masonry.

Explanatory Information:
See 4.5.5 4.2.20 for minimum edge beam details. For single skin or frames walls with external cladding, rebates are not required.

SA 4.3.2

4.3.22.10  Concrete

Concrete must comply with the following:

(a) Concrete must be manufactured to comply with AS 3600; and—
   (i) have a strength at 28 days of not less than 20 MPa (denoted as N20 grade); and
   (ii) have a 20 mm maximum nominal aggregate size; and
   (iii) have a nominal 100 mm slump.
(b) Water must not be added to the mix to increase the slump to a value in excess of that specified.
(c) Concrete must be placed, compacted and cured in accordance with good building practice.

Explanatory Information:
1. Complete discharge of the concrete from the truck should be made within one and a half hours of initial mixing with water unless a suitable retarder has been specified.
2. Compacting concrete by vibration removes air pockets and works the concrete thoroughly around reinforcement, service penetrations etc. and into corners of formwork to increase durability and resistance to termite infestation and salt damp attack. Care should be taken not to over-vibrate. The finishing and curing of slab edges provides an improved edge finish which is resistant to edge dampness.
3. Care should be taken when using chemical curing methods, because some products may not be compatible with adhesives used to fix surface finishes to the slab.

4.3.32.11  Steel reinforcement

(1) Materials used for reinforcing steel must comply with AS 2870 and be—
   (a) welded wire reinforcing fabric; or
   (b) trench mesh; or
   (c) steel reinforcing bars.
(2) Steel reinforcing bars may be substituted for trench mesh in accordance with Table 4.3.3a  Table 4.2.11a.
(3) Minimum laps for reinforcement as shown in Table 4.3.3b, Table 4.2.11b, and Figure 4.3.3a, Figure 4.2.11b must be provided where reinforcing is used.

(4) Any slab in H1D4 with a re-entrant corner must have the following reinforcement not less than 2 m in length and placed at an angle of 45° across the corner—

(a) two strips of 3-L8TM; or
(b) one strip of 3-L11TM; or
(c) 3-N12 bars.

(45) Footings and slabs-on-ground must have concrete cover between the outermost edge of the reinforcement (including ligatures, tie wire etc.) and the surface of the concrete of not less than the following:

(a) 40 mm to unprotected ground.
(b) 30 mm to a membrane in contact with the ground.
(c) 20 mm to an internal surface.
(d) 40 mm to external exposure.

(56) Reinforcement must be cleaned free of loose rust, mud, paints and oils immediately prior to the concrete pour.

(67) Reinforcement must be placed as follows:

(a) All reinforcement must be firmly fixed in place to prevent it moving during concreting operations.
(b) Reinforcement must be supported off the ground or the forms by bar chairs made from wire, concrete or plastic.
(c) When using wire chairs the minimum concrete cover (see 4.3.3(a)(4)) to the uncoated portion of the chair must be obtained.
(d) Wire chairs on soft ground or plastic membrane must be placed on flat bases.
(e) Bar chairs must be spaced at not more than 800 mm centres for steel fabric.

### Explanatory Information: Reinforcement types

Reinforcement types referenced in this clause are described as follows:

(a) Square mesh is designated in terms of the diameter of each bar and the spacing of consecutive bars. For example, SL62 consists of 6 mm bar at 200 mm spacings.

(b) Trench mesh is designated in terms of the number of longitudinal bars and the diameter of each bar. For example, 3-L11TM consists of 3 longitudinal bars each of which are 11 mm in diameter.

(c) Rebar reinforcing bars are designated in terms of the number of bars and the diameter of each bar. For example, 6-N12 consists of 6 bars each of which are 12 mm in diameter.

### Explanatory Information: Reinforcement length and angle

Reinforcement described in 4.2.11(4)(a), (b) or (c) is required to be at least 2 m long and placed at an angle of 45° to the re-entrant corner. Placement of the reinforcing should ensure the minimum concrete cover is provided in accordance with 4.2.11(5) and it is positioned so that the centre of the 2 m length is at the point of the internal angle of the slab. See Explanatory Figure 4.2.11.
Figure 4.2.11 (explanatory): Reinforcing for re-entrant corners

Explanatory Information: Cleaning and placement of reinforcing

In order to obtain a good bond between concrete and reinforcement, the reinforcement should be free of contamination by mud, paint, oils, etc. It is not necessary for the reinforcement to be completely free of rust. Some rusting is beneficial in promoting a good bond as it roughens the surface of the steel. Loose rust, however, must be removed from the reinforcement.

Reinforcement is designed to be in a particular place so as to add strength or to control cracking of the concrete. A displacement from its intended location could make a significant difference to the life or serviceability of the structure.

Supports for fabric reinforcement are provided to prevent the fabric distorting when workers walk on top of it to place the concrete and maintain the correct concrete cover to the fabric.

4.2.12 Footing and slab construction

Footing and slab construction, including size and placement of reinforcement, must be in accordance with the relevant provisions of—

(a) 4.2.13 for footings for stumps; and
(b) 4.2.14 for stiffened rafts on Class A, S and M sites; and
(c) 4.2.15 for strip footing systems on Class A, S and M sites; and
(d) 4.2.16 for footing slabs on Class A sites; and
(e) 4.2.17 for footings for single leaf masonry, mixed construction and earth retaining walls; and
(f) 4.2.18 for footings for fireplaces on Class A and S sites; and
(g) 4.2.19 for shrinkage control; and
(h) 4.2.20 for minimum edge beam dimensions; and
(i) 4.2.21 for recessed areas of slabs.
4.5.72.13 Stump footing details

(1) Footings for stumps must comply with—
   (a) the provisions of Tables 4.5.2a and Table 4.5.2b, Tables 4.2.13a, 4.2.13b or 4.2.13c for Class A and Class S sites; or
   (b) the appropriate referenced document listed in—
      (i) H1D6(3); or
      (ii) H1D4.

(2) Concrete stumps must—
   (a) be designed in accordance with—
      (i) AS 3600; or
      (ii) Tables 4.5.2a and Table 4.5.2b, Tables 4.2.13d, 4.2.13e or 4.2.13f; and
   (b) use a minimum 20 MPa concrete as defined in AS 3600.

(3) Steel stumps must be—
   (a) designed in accordance with—
      (i) AS 4100; or
      (ii) Tables 4.5.2a and Table 4.5.2b, Tables 4.2.13d, 4.2.13e or 4.2.13f; and
   (b) fully enclosed and sealed with a welded top plate; and
   (c) encased in concrete sloping away from the stump and finishing not less than 100 mm above finished ground level; and
   (d) corrosion protected in accordance with Part 6.3.

(4) Timber stumps must be designed in accordance with—
   (a) AS 1684.2, AS 1684.3 or AS 1684.4 or AS 1720.1; or
   (b) Tables 4.5.2a and Table 4.5.2b, Tables 4.2.13d, 4.2.13e or 4.2.13f.

(5) Stumps must be braced—
   (a) by a full perimeter masonry base; or
   (b) for concrete stumps — in accordance with AS 3600; or
   (c) for steel stumps — in accordance with AS 4100; or
   (d) for timber stumps — in accordance with AS 1684.2, AS 1684.3 or AS 1684.4 or AS 1720.1.

(6) Stumps must be embedded into the foundation material not less than 30% of their height above ground level or 450 mm, whichever is the greater.

(7) Pad footings for clad frame, Class A and Class S sites, must be in accordance with Table 4.2.13g and Figure 4.2.13.

Table Notes:
1. Load accounted for includes 0.98 kPa permanent floor, 0.92 kN/m permanent wall, 0.85 kPa permanent roof, permanent member self-weight, 1.5 kPa or 1.1 kN imposed floor and 0.25 kPa imposed roof.
2. Load combinations for ULS included are 1.35G and 1.2G + 1.5Q for stumps and G + 0.5Q for pad footings.
3. Minimum bearing pressure is 100 kPa for pad footings.
4. For pad footings founded on rock, the width or diameter may be reduced by half but not less than 250 mm x 250 mm or 300 mm diameter.
5. Stumps are assumed to be braced and simply-supported at both ends with an effective length factor of 1.
6. A maximum load eccentricity of length/100 has been accounted for in the stumps.
7. A roof load area of “0” must be used for stumps not supporting roof loads.
8. The length of wall load allowed for is equal to the square root of the floor area.

Table Notes:
1. The effective area supported by a pad footing is the sum of—
   a. the supported floor area; and
   b. the supported roof area (if applicable); and
   c. half the supported wall area in elevation (if applicable).
2. The width or diameter can be reduced to one half the above footings on rock.
3. The pad footings must be constructed in concrete except that footings for masonry can be used under masonry piers.
4. Pad footing sizes must also apply to footings supporting roof and floor loads only.
5. The foundation must provide an allowable bearing pressure of not less than 100 kPa.
6. The excavation must be backfilled with manually rodded tamped soil, or the footing thickness shall be increased by 50 mm.
7. Where stump pad footings provide resistance to horizontal or uplift forces, the minimum size of the footing must comply with AS 2870.
8. Braced stumps must comply with 4.5.7(5), 4.2.13(5).

Figure 4.5.7.2.13: Pad footings for clad frame, Class A and S sites

(a) Stumps
(b) Piers

Figure Notes:
1. For minimum pad footing dimensions t and D, see Table 4.2.13g.
2. For tamped fill or thickened concrete pads, see Note 6 to Table 4.2.13g.

4.2.14 Stiffened rafts Class A, S and M sites

Footing and stiffened raft slabs must comply with—
(a) For Class A and S sites — Tables 4.2.14a, 4.2.14b and Figure 4.2.14a; and
(b) For Class M sites — Table 4.2.14c and Figure 4.2.14b.

</table>

Table Notes:

1. All masonry walls must be supported on strip footings.
2. Internal strip footings must be of the same proportions as the external footings and run from external footing to external footing. “Side slip joints” consisting of a double layer of polyethylene must be provided at the sides of the footing only.
3. Infill floors may be concrete slabs, brick paving, stone flags or compacted and stabilised earth. For concrete slab infill panels, mesh may be required to control shrinkage in slab panels and around openings or restrained regions. Concrete infill slabs must use a minimum of SL62 mesh to control shrinkage (see also 4.5.41.2.19).
4. Where footings are wider than the specified width, an extra bottom bar or equivalent of the same bar size is required for each 100 mm additional width. If strip footings deeper than those required are used, the reinforcement must be increased to match that specified for the deepened proportions.
5. The measurement of Df is greater or equal to D plus 75 mm.
6. Alternative reinforcing sizes must comply with AS 2870.

Table Notes:
1. All masonry walls must be supported on strip footings.
2. For beams 700 mm or deeper, as specified in the table above, internal footings must be provided at no more than 6 m centres and at re-entrant corners to continue footings to the opposite external footing. Internal strip footings must be of the same proportions as the external footings and run from external footing to external footing. “Side slip joints” consisting of a double layer of polyethylene must be provided at the sides of the footing only.
3. Infill floors must only be used for Class A and S sites.
4. Where footings are wider than the specified width, an extra bottom bar or equivalent of the same bar size is required for each 100 mm additional width. If strip footings deeper than those required are used, the reinforcement must be increased to match that specified for the deepened proportions.
5. The measurement of $D_f$ is greater or equal to D plus 75 mm.
6. Alternative reinforcing sizes must comply with AS 2870.
7. For Class M articulated full masonry and full masonry, internal strip footings must be of the same proportions as the external footing and run from external footing to external footing.
Figure 4.5.2e2.15a: Strip footing systems for Class A and S sites

Figure 4.5.2d2.15b: Strip footing system for Class M, M-D and H sites

4.2.16 Footing slabs for Class A sites

Footing slabs for Class A sites supporting the following external wall types must comply with Figure 4.2.16:

(a) *Clad frame.*

(b) *Articulated masonry.*
Footings and slabs

(c) Masonry veneer.
(d) Articulated full masonry.
(e) Full masonry.

Figure 4.216.2e: Footing slabs for Class A sites suitable for clad frame, articulated masonry veneer, masonry veneer, articulated full masonry and full masonry

Figure Notes:
1. Use SL63 when slab length is less than 12 m.
2. Use SL62 when slab length is less than 18 m.
3. In parts of Western Australia (around Perth) and other locations where the site consists of extremely stable sands, and where specified by a professional engineer, the slab thickness may be reduced to 85 mm and reinforced as follows:
   a. Use SL53 when slab length is less than or equal to 12 m.
4. Dune sands may require compaction.

4.2.17 Footings for single leaf masonry, mixed construction and earth wall construction

Footings supporting the following external wall types must comply with the equivalent footing construction set out in Tables 4.2.17a, 4.2.17b and 4.2.17c:
   (a) Single leaf masonry.
   (b) Mixed construction.
   (c) Earth wall structures.

</table>
4.5.6.2.18 Footings for fireplaces on Class A and S sites

[2019: 3.2.5.5]

(1) Fireplaces must be supported on a pad footing—
   (a) 150 mm thick for single storey (one trafficable floor and a wall height not more than 4.2 m) construction; and
   (b) 200 mm thick for 2 storey (two trafficable floors and a wall height not more than 8 m) construction; and
   (c) reinforced top and bottom with SL72 mesh; and
   (d) extending 300 mm past the edges of the masonry except for any edge flush with the outer wall.

(2) The pad footing must form an integral part of the slab.

4.5.4.2.19 Shrinkage control

[2019: 3.2.5.3]

(1) Where brittle floor coverings, such as ceramic tiles, are to be used over an area greater than 16 m², one of the following additional measures must be taken to control the effect of shrinkage cracking—
   (a) the amount of shrinkage reinforcement (steel reinforcement mesh in the slab panel) must be—
      (i) increased to SL92 or equivalent throughout the affected slab area; or
      (ii) doubled reinforced top and bottom with an additional sheet of slab mesh throughout the affected slab area; or
   (b) the bedding system for brittle coverings must be selected on the basis of the expected slab movement and the characteristics of the floor covering (including the use of expansion joints etc.); or
   (c) the placement of floor covering must be delayed for not less than 3 months after the concrete has been poured.

(2) At re-entrant or internal corners, two strips, minimum 2 m in length, of 3–L8TM or one strip of 3–L11TM (or 3–N12 bars) must be placed diagonally across the corner in accordance with Figure 4.5.4.

(2) Where a footing or slab supports a concentrated load from a structural steel column, localised thickening must—
   (a) be provided in accordance with—
      (i) for tiled floor and tiled roof, Tables 4.2.19a, 4.2.19b or 4.2.19c; or
      (ii) for timber floor and metal roof, Tables 4.2.19d, 4.2.19e or 4.2.19f; and
   (b) be centred under the structural steel column; and
   (c) have SL72 reinforcement with a minimum 50 mm of concrete cover (see Figure 4.2.19).

**Table Notes:**
1. Load accounted for includes 0.53 kPa permanent timber floor, 0.4 kPa permanent metal roof, 1.16 kN/m permanent wall, permanent member self-weight, 1.5 kPa or 1.1 kN imposed floor and 0.25 kPa imposed roof.
2. Load combinations included are G + 0.5Q for ULS.
3. Minimum bearing pressure is 1000 kPa for pad footings.
4. The length of wall allowed for is equal to the square root of the floor area.
4.5.2.20 Minimum edge beam dimensions

Except for waffle raft slabs, where the edge rebate is more than 150 mm in depth, footings located on a Class A or Class S sites, the width of the edge beam at the base of the rebate must not be less than 200 mm, except that if R10 or N10 ties at 900 mm spacing (or equivalent) are provided to resist vertical forces, the width of the edge beam at the base of the rebate can be reduced to 150 mm.

4.2.21 Recessed areas of slabs

(1) Where a recess in a slab is provided, it must comply with one of the following:
   (a) For recess depths less than or equal to half the nominal slab thickness, the reinforcing mesh must have a minimum lap length of 400 mm measured from the inside face of the recess (see Figure 4.2.21a).
   (b) For recess depths greater than half the nominal slab thickness (see Figure 4.2.21b)—
       (i) top reinforcing mesh must overlap the bottom reinforcing mesh by not less than 400 mm; and
       (ii) bottom reinforcing mesh must be two layers of SL72.

(2) Concrete cover to reinforcing in (1)(a) and (b) must comply with 4.2.11(5).
Figure 4.2.21a: **Recess depths less than or equal to nominal slab thickness**

5.6.6 Fixing straps and tie-down systems
5.2.12 Lintels
5.2.13 Vertical articulation joints

**Part 5.7 Weatherproofing of masonry**

5.7.1 Application of Part 5.7
5.2.6.7 Cavities
5.2.7.3 Damp-proof courses and flashings – material
5.2.9.4 Damp-proof courses and flashings – installation
5.2.9.5 Weepholes
5.7.6 Weatherproofing for single leaf masonry walls
5.1.1 Scope

(1) This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for—
   (a) masonry veneer (see Part 5.2); and
   (b) cavity masonry (see Part 5.3); and
   (c) single leaf unreinforced masonry (see Part 5.4); and
   (d) isolated masonry piers (see Part 5.5); and
   (e) masonry components and accessories (see Part 5.6); and
   (f) weatherproofing of masonry (see Part 5.7).

(2) For other masonry provisions not included in this Section of the ABCB Housing Provisions, refer to the following Deemed-to-Satisfy Provisions in NCC Volume Two: reinforced masonry (see H1D5(4)).
   (a) Unreinforced masonry (see H1D5(1)).
   (b) Reinforced masonry (see H1D5(1) and (2)).
   (c) Masonry accessories (see H1D5(1)).
   (d) Weatherproofing of masonry (see H2D4).

5.1.2 Application

The application of Section 5 of the ABCB Housing Provisions is subject to the following:
   (a) The Governing Requirements of NCC 2022 Volume Two.
   (b) Any conditions set out within the following Deemed-to-Satisfy Provisions of NCC Volume Two:
      (i) H1D5(3)(a) H1D5(1), for masonry veneer.
      (ii) H1D5(2), for cavity masonry.
      (iii) H1D5(3), for unreinforced masonry.
      (iv) H1D5(3)(b) H1D5(5), for isolated masonry piers.
      (v) H1D5(6), for masonry accessories.
      (vi) H2D4(2)(c), for weatherproofing of masonry.
   (c) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:
In NCC 2019, the content of Section 5 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.3.5 and 3.3.6 of NCC 2019 Volume Two.
NCC 2019 Volume Two did not include an acceptable construction practice for Parts 3.3.1, 3.3.2, 3.3.3 or 3.3.4.
5.2.1 Application of Part 5.2

(1) Part 5.2 is subject to the limitations set out at H1D5(3)(a) and H1D5(1)(c).

(2) Part 5.2 need not be complied with if H1D5(1)(a) or (b) is complied with.

5.2.2 Height of wall limitation

Masonry veneer walls must not be greater than 8.5 m in height when measured above the adjacent finished ground level.

5.2.3 Openings in masonry veneer

(1) Except where excluded by (2), openings in masonry veneer must be spanned by steel lintels.

(2) Openings in masonry veneer not more than 500 mm wide need not be provided with a steel lintel provided the opening is adequately supported.

5.2.4 Damp-proof courses and flashing materials

Damp-proof courses and flashing materials must be in accordance with 5.7.3 and 5.7.4.

5.2.5 Vertical articulation joints

Vertical articulation joints are to be installed in accordance with 5.6.8.

5.2.6 Engaged piers

Where engaged piers are installed to support subfloor framing, they must comply with the provisions of this Part and be constructed as follows:

(a) Footings for piers must comply with Section 4.

(b) Engaged piers must not support more than a single storey with a roof framing span of not more than 12 m.

(c) Piers must be spaced at not more than 3 m centres with floor framing complying with—

(i) H1D(3) for steel framing; and

(ii) H1D(4) for timber framing; and

(iii) H1D(5) for structural steel framing.

(d) Piers must be—

(i) not more than 1.2 m high; and

(ii) a minimum thickness of 100 mm inclusive of mortar; and

(iii) a width greater than the depth of the timber or steel section which it is supporting (See Figure 5.2.14)
5.2.6). (e) Notwithstanding (c), engaged piers must be located beneath—
   (i) each side of window and door openings; and
   (ii) concentrated roof loads, inclusive of any roof beams and girder trusses.

(f) Piers must be tied or bonded to the external masonry wall, and where ties are used they must comply with 5.2.46 5.6.5.

(g) Piers formed from hollow-core masonry units must be filled with grout.

Figure 5.2.142.6: Engaged pier
5.3.1 Application of Part 5.3

(1) Part 5.3 applies subject to the limitations set out at H1D5(2)(c).
(2) Part 5.3 need not be complied with if H1D5(2)(a) or (b) is complied with.

5.3.2 Height of wall limitation

Cavity masonry walls must not be greater than 8.5 m in height when measured above the adjacent finished ground level.

5.3.3 External walls

(1) Cavity masonry walls must comply with the relevant provisions of this Part and Parts 5.6 and 5.7 and be constructed as follows:
   (a) The height of the wall between lateral support (floor or ceiling or roof diaphragm) must be not more than 3 m.
   (b) Cavity masonry walls subject to wind loads must be supported by masonry cross walls.
   (c) Masonry cross walls must be—
      (i) not less than 2 m in length; and
      (ii) at not more than 5.1 m centres where the length of the cavity wall being supported does not contain any opening or control joint; and
      (iii) not more than 2.5 m from the edge of a control joint in the length of the cavity wall being supported; and
      (iv) not more than a distance from the edge of an opening in the length of cavity wall being supported as stated in Table 5.3.3; and
      (v) located at both edges of openings of width greater than 2700 mm; and
      (vi) directly connected to the internal leaf of the cavity wall being supported using—
         (A) properly bonded units with at least 90 mm engagement on each side of the interface with the selected bond pattern but not less than every fourth course of masonry; or
         (B) medium duty Type A cavity wall ties in aligning mortar bed joints at a vertical spacing of not more than 300 mm; and
      (vii) connected by a floor or ceiling diaphragm to the wall being supported where floor or ceiling connections are designed in accordance with the relevant material design standard AS/NZS 4600, AS 1720.1 or AS 3600, as appropriate.

(2) Cavity masonry walls must be constructed of two leaves, with each leaf not less than 90 mm wide.

(3) In cavity masonry construction, a cavity must be provided between the inner and outer masonry leaves as follows:
   (a) The cavity must be not less than 35 mm and not more than 75 mm in width.
   (b) Except for steel mullions, the minimum cavity width specified in (a) is to be maintained between the outer masonry leaf and any insulation or services located in the cavity.
   (c) Where steel mullions are located in a cavity as permitted by (b), a vertical damp-proof course must be placed between the outer masonry leaf and the mullion to prevent moisture penetration.
### 5.3.3 Spacing of return walls for cavity walls with openings — distance from the edge of an opening (mm)

<table>
<thead>
<tr>
<th>Wind class</th>
<th>Opening width (mm)</th>
<th>900</th>
<th>1500</th>
<th>2100</th>
<th>2700</th>
</tr>
</thead>
<tbody>
<tr>
<td>N3</td>
<td>2100</td>
<td>1800</td>
<td>800</td>
<td>400</td>
<td></td>
</tr>
<tr>
<td>N2</td>
<td>3200</td>
<td>2900</td>
<td>2600</td>
<td>2300</td>
<td></td>
</tr>
<tr>
<td>N1</td>
<td>2500 (Note)</td>
<td>2200 (Note)</td>
<td>1900 (Note)</td>
<td>800 (Note)</td>
<td></td>
</tr>
</tbody>
</table>

**Table Notes:**
The spacing for N1 is smaller than for N2 because 5.6.5 states that for cavity walls with N1, light duty cavity ties are to be used. This results in only relying on one leaf to resist the load instead of sharing it equally as per clause 7.7.3 of AS 3700.

**Explanatory Information:**
Steel mullions complying with AS 4773.1 and 4773.2 used to support wind loads may be placed within a cavity. Flat ceiling capable of performing diaphragm action may act as lateral support to walls provided the structure has been specifically designed.

### 5.3.4 Internal walls

(1) Where internal masonry walls intersect with other internal or external walls they must comply with the relevant provisions of this Part and be—
   (a) not less than 75 mm thick; and
   (b) either—
      (i) bonded at the junctions of the intersecting walls; or
      (ii) provided with an articulation joint in accordance with 5.6.8.

(2) Where a vertical articulation joint is provided in an internal masonry wall it must be formed in accordance with 5.6.8.

### 5.3.5 Openings in cavity masonry

(1) Except where excluded by (2), openings in cavity masonry must be spanned by steel lintels in accordance with 5.6.7.

(2) Openings in cavity masonry not more than 600 mm wide need not be provided with a steel lintel provided the opening is adequately supported.

### 5.3.6 Damp-proof courses and flashing materials

*Damp-proof courses and flashing must be provided in accordance with 5.7.3 and 5.7.4.*

### 5.3.7 Vertical articulation joints

*Vertical articulation joints are to be installed in accordance with 5.6.8.*
5.4.1 Application of Part 5.4

(1) Part 5.4 applies subject to the limitations set out at H1D5(3)(c).

(2) Part 5.4 need not be complied with if H1D5(3)(a) or (b) is complied with.

5.4.2 External walls

(1) Single leaf unreinforced masonry walls with engaged piers and return walls must comply with the relevant provisions of this Part and be constructed in accordance with the following:
   (a) The roof frame must be connected continuously to the top of the wall (see Figure 5.4.2a).
   (b) Stack bonded piers must have wall ties at every fourth course.
   (c) Pier and return supports size limitations for—
      (i) single leaf unreinforced masonry walls with engaged piers must comply with Table 5.4.2a and Figure 5.4.2b; and
      (ii) single leaf unreinforced masonry walls with return supports must comply with Table 5.4.2b and Figure 5.4.2c.
   (d) An engaged pier or return wall must be provided at both sides of an opening.
   (e) Openings must be not more than the spacing between the engaged piers.
   (f) For openings more than the spacing width, the engaged piers either side of the opening must be designed in accordance with AS 3700.
   (g) Articulation joints must be located within 300 mm of vertical supports in accordance with 5.6.8.

(2) A Class 10a building containing not more than 1 storey may be enclosed with single leaf masonry external walls not less than 110 mm in thickness, provided that—
   (a) the building measured in the direction of the span of the roof is not more than 9 m and the height is not more than 2.4 m; and
   (b) piers are formed that are not less than 230 mm wide, project not less than 1200 mm and are spaced at not more than 550 mm centres; and
   (c) the roof does not place any spreading thrust onto the external walls; and
   (d) the Class 10a building is located in an area with a design wind speed of not more than N2.

</tbody>
</table>

Table Notes:
1. Dimensions are in mm.
2. Return supports are not required for 140 mm and 190 mm thickness walls.

Figure 5.4.2a: Top lateral restraint detail for unreinforced single leaf masonry walls

Wall plate fixing to roof framing and tie down in accordance with AS 1684.2

Figure Notes:
Tie down of wall must comply with 5.6.6.
Figure 5.4.2b: Piers in external single leaf masonry walls to AS 3700

Piers each side of door opening
5.4.3 Internal walls

Internal masonry walls must be engaged with other walls, must comply with the relevant provisions of this Part and must be—

(a) not less than 75 mm thick; and

(b) supported by either—

(i) the ceiling structure in accordance with Figure 5.4.3a; or

(ii) return walls in accordance with Figure 5.4.3b.
Figure 5.4.3a: Support for internal walls—supported by ceiling structure

Figure Notes:
1. Timber joist to be fixed to top plate in accordance with H1D6(4).
2. Fixing of top plate to masonry wall to be in accordance with 5.6.6.
Figure 5.4.3b: Support for internal walls—supported by return walls

Figure Notes:
1. An opening of not more than 600 mm x 900 mm is allowed to internal walls without additional support.
2. Openings larger than as described in Note 1 and door openings must be supported.
3. The maximum allowable height for the wall is described in Figure 5.4.3a.
4. Articulation joints must be in accordance with 5.6.8.

Explanatory Information:
A full height door frame or stud fastened at the roof framing and tied to the wall at 300 mm centres can be considered equivalent to a return wall.

5.4.4 Vertical articulation joints

Vertical articulation joints must be provided in accordance with 5.6.8.

5.4.5 Damp-proof courses and flashing materials

Where required, damp-proof courses and flashing must be provided in accordance with 5.7.3 and 5.7.4.
5.3.15.1 **Application of Part 5.3.5**

(1) Part 5.3 Part 5.5 is subject to the limitations set out in H1D5(5)(c).

(2) Part 5.3 Part 5.5 need not be complied with if H1D5(5)(a) or (b) is complied with.

5.3.25.2 **Piers supporting carports, verandahs, porches and similar roof structures**

Isolated piers supporting carports, verandahs, porches and similar roof structures, or vehicle access door openings, which form part of the main roof, or are attached to a wall of a Class 1 building must—

(a) be not less than 290 x 290 mm in section; and

(b) be not more than 2.7 m high (see Figure 5.3.2 Figure 5.5.2); and

(c) be spaced at not more than 3 m centres (see Figure 5.3.2 Figure 5.5.2); and

(d) provide a bearing length of not less than 150 mm for any supported members; and

(e) comply with the relevant provisions of this Part.

Figure 5.3.25.2: Piers under main roof

2.7 m max.

3 m max. centres

Minimum 290 x 290 mm piers

5.3.35.3 **Piers supporting tiled roofs**

Isolated piers supporting tiled roofs must have—

(a) a built-in 32 x 0.8 mm galvanised steel strap fixed to the roof structure that extends the full height of the pier; and

(b) a 4.6 grade M12 galvanised steel rod which is cast into the footing when poured and looped and fixed around the galvanised steel strap required by (a).
5.3.45.4  Piers supporting sheet roofs

Isolated piers supporting sheet roofs must have—

(a) a built-in 32 x 0.8 mm galvanised steel strap fixed to the roof structure extending the full height of the pier which is looped and fixed around a 4.6 grade 16 mm diameter galvanised steel rod cast into the footing when poured; or

(b) a 4.6 grade M16 galvanised steel rod cast into the footing, threaded at the top and extending the full height of the pier to connect to the roof structure.

5.3.55.5  Piers for freestanding carports

Piers for freestanding carports must—

(a) be not less than 290 x 290 mm with the central core filled with 20 MPa concrete, or an exposure class mortar (see Table 5.2.4 Table 5.6.4) complying with 5.2.4 5.6.4; and

(b) have the core reinforced with one Y16 steel reinforcing rod cast into the footing and extending the full height of the pier to connect to the roof structure.

5.3.65.6  Subfloor piers

Subfloor isolated piers must be a minimum of 190 x 190 mm in section and comply with Figure 5.3.6 Figure 5.5.6 for height requirements.
Figure 5.3.6.5.6: Sub-floor isolated piers — maximum height and sectional details

DRAFT
5.6.1 Application of Part 5.6

(1) Part 5.6 is subject to the limitations set in H1D5(6)(c)(i), (ii) and (iii).
(2) Part 5.6 need not be complied with if H1D5(6)(a) or (b) is complied with.

5.2.36.2 Masonry units

(1) Masonry veneer masonry units must have a minimum characteristic unconfined compressive strength of—
   (a) 3 MPa for solid or cored units; or
   (b) 10 MPa for hollow units.
(2) Cavity masonry and single skin masonry units must have a minimum compressive strength of—
   (a) 5 MPa for solid or cored units; or
   (b) 10 MPa for hollow units.
(3) Masonry veneer cavity walls must have a minimum veneer leaf thickness of 90 mm.
(4) Subject to (45), masonry units must be—
   (a) either clay or calcium silicate brick or concrete brick or block; and
   (b) classified and used in the exposure conditions appropriate to their classification as described in (56).
(45) Mixing of panels consisting of clay masonry units with panels consisting of concrete or calcium silicate masonry units is not permitted unless—
   (a) at vertical junctions, a control joint is installed; and
   (b) at horizontal junctions between panels of different materials, a slip joint using a membrane similar to that used for damp-proof courses is installed.
(56) Masonry unit exposure classifications and corresponding masonry unit applications are as follows:
   (a) Protected (P) masonry units are suitable for use in locations such as—
      (i) internal walls; and
      (ii) external walls that are coated or rendered; and
      (iii) walls above damp-proof courses provided the wall is protected at the top by a roof, eaves, coping, topping or the like.
   (b) General Purpose (GP) masonry units are suitable for use in all locations except those where ‘Exposure class’ (Exp) is required.
   (c) Exposure class (Exp) masonry units are suitable for use in all locations including severe local conditions such as—
      (i) below the damp-proof course in areas where walls are expected to be attacked by salts in the ground water or brickwork itself (salt attack or salt damp); and
      (ii) on sea fronts where walls are exposed to attack from salt spray; and
      (iii) in heavily polluted areas subject to deposition of atmospheric pollution; and
      (iv) under regular cyclic freeze and thaw conditions.

Explanatory Information:
The exposure classification or durability of a masonry unit is a measure of its resistance to attack by soluble salts, either
in the ground or in the atmosphere. All masonry products manufactured are classified by their durability. The majority of uses will require either an Exposure class (Exp) product or a General Purpose (GP) product.

5.2.46.3 Mortar mixes

Mortar used for masonry construction must comply with AS 3700 or AS 4773 except that the mortar may be mixed by volume in the proportions stated in Table 5.2.4 Table 5.6.3.

Table 5.2.46.3: Acceptable mortar mixes

<table>

<td></td>
</tr>
</tbody>
</table>

Table Notes:
1. Additives may be used provided they comply with the appropriate specified rate.
2. Mortar mixes for masonry require the use of methyl cellulose water thickener.

5.2.56.4 Mortar joints

(1) Unless otherwise specified, masonry bed and perpend joints must have a nominal thickness of 10 mm.

(2) Where raked joints are used they must not be—
   (a) raked deeper than 10 mm; or
   (b) used in saline environments or areas subject to heavy industrial airborne pollution: or
   (c) more than 5 mm for masonry units at least 90 mm wide; or
   (d) more than 10 mm for masonry units at least 110 mm wide.

5.2.10.6.5 Wall ties

(4) Veneer wall ties must—
   (a) comply with AS/NZS 2699.1 and be—
      (i) light duty veneer ties in areas where the design wind speed is not more than N2; and
      (ii) medium duty ties—
         (A) in areas where the design wind speed is more than N2; and
         (B) where engaged piers are provided; and
   (b) be spaced and fixed in accordance with Table 5.2.10a and Table 5.2.10b; and
   (c) be protected against corrosion in accordance with Table 5.2.10a.

(1) Masonry wall ties must—
   (a) comply with AS/NZS 2699.1 and—
      (i) for masonry veneer walls be—
         (A) minimum light duty veneer ties in areas where the design wind speed is not more than N2; and
(B) minimum medium duty veneer ties in areas where the design wind speed is more than N2; and

(ii)

(A) minimum light duty cavity ties in areas where the design wind speed is N1; and

(B) minimum medium duty cavity ties in areas where the design wind speed is more than N1; and

(iii) where non-engaged piers are provided, piers must be tied to walls using medium duty ties; and

(iv) for monolithic or solid masonry construction be minimum medium duty ties; and

(b) be spaced and fixed in accordance with Tables 5.6.5a, 5.6.5b and 5.6.5c (see also Figures 5.6.5a and 5.6.5b); and

(c) be protected against corrosion in accordance with Table 5.6.5d.

**Table Notes:**

1. Ties are to be embedded a minimum of 50 mm into each masonry leaf fixed to the supporting frame at all regular stud positions using screws or nails.

2. Masonry wall ties must be installed in such a manner as to prevent moisture travelling along the tie to the inner leaf of masonry or the frame.

Figure 5.6.5a: Wall tie details (lowset)
5.6.5b: **Wall tie details (highset)**

Explanatory Information:
Wall ties that are suitable for use in a more severe exposure condition are also suitable for use in less severe exposure conditions, i.e. stainless steel and engineered polymer ties are suitable for use in all conditions and 470g/m² galvanised ties can be used in all exposure conditions except the most severe.

**5.6.6 Fixing straps and tie-down systems**

(1) **Timber door and window frames abutting cavity masonry must be**—
   (a) fixed with 300 mm long 32 mm x 0.8 mm kinked galvanised steel straps; and
   (b) fixed to the back of frames; and
   (c) set into courses not less than 150 mm at not more than 400 mm intervals.

(2) For areas with a design wind speed of N1 or N2 and a building width from outside wall to outside wall of not more than 10 m in the direction of the roof span (see Figure 5.6.6a), sheet metal and tiled roofs must be tied down using one of the following methods:
   (a) 32 mm x 0.8 mm galvanised steel straps at not more than 1.2 m centres and corresponding with truss or rafter positions, looped around 10 mm diameter galvanised mild steel rods—
      (i) built-in across the cavity at a course not more than 900 mm below the top of the wall; and
      (ii) embedded not less than 50 mm into each leaf.
   (b) 25 mm x 1 mm galvanised steel straps at not more than 1.2 m centres and corresponding with truss or rafter positions, built-in to masonry inner leaf not less than 50 mm and 900 mm below the top of the wall (see Figure 5.2.106.5).
5.6.6b). 

(3) Roof framing supporting tiled roofs on single leaf *unreinforced masonry* walls with piers or return walls must have—
(a) a built-in 32 mm x 0.8 mm galvanised steel strap fixed to the roof structure that extends the full height of the pier or return wall; and
(b) a 4.6 grade M12 galvanised steel rod which is cast into the footing when poured and looped and fixed around the galvanised steel strap required by (a) (see Figure 5.6.6c).

(d) Roof framing supporting sheet roofs on single leaf *unreinforced masonry* with piers or return walls must have—
(a) a built-in 32 mm x 0.8 mm galvanised steel strap fixed to the roof structure extending the full height of the pier or return wall which is looped and fixed around a 4.6 grade 16 mm diameter galvanised steel rod cast into the footing when poured; or
(b) a 4.6 grade M16 galvanised steel rod cast into the footing, threaded at the top and extending the full height of the pier or return wall to connect to the roof structure.

Figure 5.6.6a: Building width

![Diagram of Building width and roof frame connections](image-url)
Explanatory Information:

Roof tie-down over openings greater than 1200 mm wide in masonry construction must be specifically designed in accordance with relevant material and structural design standards.

5.212.6.7 Lintels

Where a lintel is required it must comply with the following:

(a) Steel lintels must comply with this Part or H1D6(43).

(b) Steel lintels must—

(i) be sized in accordance with Table 5.2.12a Table 5.6.7a; and

(ii) be installed with the long leg of lintel angle vertical; and

(iii) not carry more than a 110 mm thick veneer or otherwise be wide enough so that no more than 25 mm of masonry overhang is provided; and

(iv) not carry masonry more than 3 m in height when measured above the opening; and

(v) have a minimum bearing length at each end of the lintel of—

(A) for clear spans not more than 1 m - 100 mm; or

(B) for clear spans more than 1 m - 150 mm (See Figure 5.2.12 Figure 5.6.7); and

(i) have a minimum of three courses of masonry over openings; and

(ii) comply with the corrosion protection requirements of Table 5.2.12b Table 5.6.7b.

Table 5.2.12a6.7a: Masonry veneer lintel sizes

</tr>
</tbody>
</table>

Table Notes:

1. AS/NZS 2699.3 contains information on the corrosivity category locations in Australia and provides a method for determining coating thickness for lintels.

2. Additional decorative coatings can be applied, but must not be considered for the purpose of satisfying the requirements of this Table.

3. Any lintel with a coating that is modified, i.e. by cutting, welding, or where damaged, must have the coating restored to provide an equivalent level of protection provided by the original coating.
Vertical articulation joints

(1) Vertical articulation joints must be provided in masonry veneer walls in accordance with (2), except in walls constructed on sites where the soil classification is A or S (see Part 4.4.4.2.2).

(2) Articulation joints between masonry elements must have a width of not less than 10 mm and be provided (see Figures 5.2.13a, 5.6.8a and 5.2.13b, 5.6.8b, and 5.2.13c) —
   (a) in straight, continuous walls having no openings with openings less than 900 mm x 900 mm or walls without openings - at not more than 6 m centres and within 4.5 m, but not closer than 470 mm of all corners; and
   (b) in straight, continuous walls with openings more than 900 mm x 900 mm - at not more than 5 m centres and located so that they are not more than 1.2 m away from openings; and
   (c) where the height of the wall changes by more than 20% - at the position of change in height; and
   (d) where a wall changes in thickness; and
   (e) at control or construction joints in footings or slabs; and
   (f) at junctions of walls constructed of different masonry materials.

(3) Articulation joints must not be constructed adjacent to arched openings.

(4) Articulation joints must either be filled with flexible sealant that is supported during installation by —
   (a) a compressible foam or polystyrene filler and a flexible sealant (see Figure 5.2.13c) (see Figures 5.6.8d and 5.6.8e); or
   (b) a purpose made backer rod and a flexible sealant (see Figure 5.2.13d, Figures 5.6.8c, 5.6.8d, 5.6.8e and 5.6.8f).
Figure 5.2.13a & 6.8a: Example of vertical articulation joint locations in plan view
Figure 5.2.13b.6.8b: Vertical articulation joints

Mastic sealant
Figure 5.6.8e: Articulation joint in unreinforced masonry veneer wall with compressed foam

Compressible foam joint filler and mastic-backing

Mastic sealant
Figure 5.6.8f: Articulation joint in cavity masonry wall

Explanatory Information:
For the purposes of 5.2.13, 5.6.8, the vertical articulation joint also performs the function of a contraction or expansion.
5.7.1 Application of Part 5.7

(1) Part 5.7 applies subject to the limitation set out at H2D4(4)(c).

(2) Part 5.7 need not be complied with H2D4(4)(a) or (b) is complied with.

5.2.6.7.2 Cavities

(4) The clear width of a cavity between the masonry veneer and the exterior face of the supporting frame must be not less than 25 mm wide and where the masonry veneer is constructed on a slab-on-ground, the cavity must be drained to the outside in accordance with 5.2.9.

(1) For masonry veneer, the clear width of a cavity between the masonry veneer and the exterior face of the supporting frame must not be—
   (a) less than 25 mm wide; and
   (b) more than 75 mm wide.

(2) For cavity masonry, the clear width of a cavity between the inner and outer masonry leaves must not be—
   (a) less than 35 mm; and
   (b) more than 75 mm.

(3) Where masonry veneer and cavity masonry in (1) and (2) are constructed on a slab-on-ground, the cavity must be drained outside in accordance with 5.2.9.

(4) The exterior masonry leaf must not overhang more than 15 mm past the edge of the slab.

Explanatory Information:
The 25 mm clear width of the cavity needs to be maintained regardless of any wall membranes, sheet bracing or services installed to the supporting frame.

Where mullions are located within a cavity, a vertical damp-proof course must be placed between the outer masonry leaf and the mullion to prevent moisture penetration.

5.2.7.7.3 Damp-proof courses and flashings – material

Damp-proof courses and flashings must consist of—

(a) a material that complies with AS/NZS 2904; or
(b) embossed black polyethylene film of high impact resistance and low slip, with a nominal thickness of 0.5 mm prior to embossing, and comply with clause 7.6 of AS/NZS 2904; or
(c) polyethylene coated metal, that has an aluminium core of not less than 0.1 mm thick, is coated both sides with bitumen adhesive enclosed in polyethylene film of not less than 0.1 mm thick on each face, and has a nominal total thickness of not less than 0.5 mm prior to embossing; or
(d) bitumen impregnated materials of not less than 2.5 mm thick, that comply with clause 7.5 of AS/NZS 2904; or
(e) termite sheet materials complying with Part 3.4 (with no penetrations) serving the purpose of a damp-proof course and/or flashing that is continuous through the wall or pier.
5.2.87.4 Damp-proof courses and flashings – installation

[2019: 3.3.5.8]

(1) Damp-proof courses and flashings must be—
   (a) located so as to form a continuous damp-proofing barrier—
      (i) around the bottom perimeter of walls where constructed on a concrete slab; and
      (ii) in walls and piers below suspended floors; and
      (iii) where a masonry wall passes through a roof; and
      (iv) where a roof abuts an external masonry wall; and
      (v) to the bottom and tops of windows and doors and the like in accordance with (3), except a damp-proof course or a flashing need not be provided to the top of a window or door where the opening is protected by an eave of a width more than 3 times the height of the masonry veneer above the opening; and
   (b) continuous through the wall or pier and be visible from the outside face of the wall.

(2) The location of a damp-proof course or flashing serving as a damp-proof course, must be not less than—
   (a) 150 mm above the adjacent ground level; or
   (b) 75 mm above the finished surface level of adjacent paved, concreted or landscaped areas that slope away from the wall; or
   (c) 50 mm above finished paved, concreted or landscaped areas complying with 3.3.3(b)(ii) and protected from the direct effects of the weather by a carport, verandah or the like; or
   (d) in low rainfall intensity areas—
      (i) 15 mm above finished paved, concreted or landscaped areas; or
      (ii) 50 mm above finished paved, concreted or landscaped areas if the damp-proof course is protected from the direct effects of the weather by a carport, verandah or the like.

(3) Sill and head flashings serving openings must be—
   (a) installed so that the flashing extends not less than 150 mm beyond the reveals on each side of the opening; and
   (b) located not more than—
      (i) one course below the sill brick course; and
      (ii) 300 mm above the opening; and
   (c) turned up in the cavity not less than 150 mm above the opening; and
   (d) embedded not less than 30 mm into the masonry veneer; and—
      (i) for masonry veneer, the masonry leaf; and
      (ii) for cavity masonry, the outer masonry leaf; and
   (e) attached to the window or wall framing.

5.2.97.5 Weepholes

[2019: 3.3.5.9]

(1) Except where excluded by (2), open perpend joints (weepholes) must be created in the course immediately above any flashing (including above any damp-proof course acting as a flashing) and be—
   (a) a minimum of 50 mm in height, by the width of the vertical mortar joint; and
   (b) at not more than 1.2 m centres; and

(2) Weepholes are not required in the following locations:
   (a) Where head openings are less than 1.2 m wide.
   (b) Beneath window and door sills.
5.7.6 Weatherproofing for single leaf masonry walls

[New for 2022]

1. A waterproof coating material must be applied to all external single skin masonry walls in accordance with the following:
   (a) The coating must extend from the upper most exposed part of the wall—
       (i) to a level adjacent to the internal finished floor level, if the external masonry wall leaf overhangs the edge of the slab by not less than 10 mm; or
       (ii) 50 mm below the internal floor level if no edge overhang is provided to the blockwork.
   (b) Acceptable external waterproof finishes are—
       (i) three coats of 100% acrylic based exterior quality gloss paint; or
       (ii) one complete coat of cement based paint and two coats of 100% acrylic based exterior quality gloss paint; or
       (iii) clear water repellent, provided the wall is protected by a roof overhang.

2. Windows must be installed in accordance with Figure 5.7.6a.

3. A damp-proof course, vapour barrier or damp-proofing membrane must be installed in accordance with Figure 5.7.6b.
Figure 5.7.6a: **Typical window installation for single skin masonry**
Figure 5.7.6b: Typical damp-proof course and weatherproofing detail for single skin masonry

6.3.5 Lintels
6.3.6 Columns
6.3.7 Fixings and bearing for structural steel members
6.3.8 Cuts and penetrations through structural steel members
6.3.49 Corrosion protection
6.1.1 Scope

(1) This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for—
   (a) subfloor ventilation (see Part 6.2); and
   (b) structural steel members (see Part 6.3).

(2) For other framing provisions not included in this Section of the ABCB Housing Standard, refer to the following Deemed-to-Satisfy Provisions in NCC Volume Two:
   (a) Steel framing (see H1D6(2)).
   (b) Timber framing (see H1D6(3)).
   (c) Use of structural software (see H1D6(6)).

Explanatory Information:
Part 6.2 applies to the subfloor space of all suspended floors of a building or deck, including but not limited to, timber and steel-framed subfloors and suspended concrete slabs.

6.1.2 Application

The application of Section 6 of the ABCB Housing Provisions is subject to the following:
   (a) The Governing Requirements of NCC 2022 Volume Two.
   (b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:
In NCC 2019, the content of Section 6 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.4.1 and 3.4.4 of NCC 2019 Volume Two.
NCC 2019 Volume Two did not include an acceptable construction practice for Parts 3.4.2 or 3.4.3.
6.2.1 Subfloor ventilation

(1) Subfloor spaces must—
   (a) be provided with openings in external walls and internal subfloor walls in accordance with Table 6.2.1a for the climatic zones given in Figure 6.2.1a; and
   (b) have clearance between the ground surface and the underside of the lowest horizontal member in the subfloor in accordance with Table 6.2.1b (see Figure 6.2.1b and Figure 6.2.1c).

(2) In addition to (1), a subfloor space must—
   (a) be cleared of all building debris and vegetation; and
   (b) have the ground beneath the suspended floor graded in accordance with 3.3.3; and
   (c) contain no dead air spaces; and
   (d) have openings evenly spaced as far as practicable (see Figure 6.2.1d); and
   (e) have openings placed not more than 600 mm in from corners.

(3) In double leaf masonry walls, openings specified in (1) must be provided in both leaves of the masonry, with openings being aligned to allow an unobstructed flow of air (see Figure 6.2.1d).

(4) Openings in internal subfloor walls specified in (1) must have an unobstructed area equivalent to that required for the adjacent external openings (see Figure 6.2.1d).

(5) Where the ground or subfloor space is excessively damp or subject to frequent flooding, in addition to the requirements of (1) to (4)—
   (a) the subfloor ventilation required in (1) must be increased by 50%; or
   (b) the ground within the subfloor space must be sealed with an impervious membrane; or
   (c) subfloor framing must be—
      (i) where above ground — above ground durability Class 1 or 2 timbers or H3 preservative treated timbers in accordance with AS 1684.2, AS 1684.3 or AS 1684.4; or
      (ii) where in-ground — in-ground durability Class 1 or 2 timbers or H5 preservative treated timbers in accordance with AS 1684.2, AS 1684.3 or AS 1684.4; or
      (iii) steel in accordance with NASH Standard ‘Residential and Low-Rise Steel Framing’ Part 2.

Table 6.2.1a: Subfloor openings

<table>
<thead>
<tr>

<tr>
<td>B</td>
<td>4000</td>
<td>2000</td>
</tr>
<tr>
<td>C</td>
<td>6000</td>
<td>3000</td>
</tr>
</tbody>
</table>

Table Notes:
In situations where openings in external walls and internal subfloor walls, including separating walls, are not able to be provided, additional measures must be provided to ensure that the overall level of ventilation of the subfloor space is maintained. This may include measures similar to those in 6.2.1(5) i.e. providing durability class timbers, or having the ground sealed in the subfloor space with an impervious membrane.
Table 6.2.1b: Ground clearance

<table>
<thead>
<tr>
<th>Climatic zone (see Figure 6.2.1a)</th>
<th>Minimum ground clearance height where termite inspection or management system is not required (mm)</th>
<th>Minimum ground clearance height where termite inspection is required (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A, B and C</td>
<td>150</td>
<td>400</td>
</tr>
</tbody>
</table>

Table Notes:
1. 400 mm clearance required only where termite management systems are installed that need to be inspected (see Part 2.2.4).
2. On sloping sites the 400 mm clearance required by 1 may be reduced to 150 mm within 2 m of external walls in accordance with Figure 6.2.1b.

Figure 6.2.1a: Climatic zones based on relative humidity

ZONE A - 9am RH < 60%
ZONE B - 9am RH > 60% and 3pm RH > 40%
ZONE C - 9am RH > 70% and 3pm RH > 60%
RH = Relative Humidity
Figure 6.2.1b: Subfloor clearance requirements

Figure Notes:
See notes to Tables 6.2.1a and 6.2.1b.

Figure 6.2.1c: Subfloor clearance requirements – detail
Figure Notes:
See notes to Tables 6.2.1a and 6.2.1b.

Figure 6.2.1d: Typical subfloor ventilation details — typical cross ventilation of subfloor area

Explanatory Information:
Subfloor ventilation is cross ventilation of the subfloor space between the underside of the subfloor and the ground surface under a building.

Ground moisture rising into or entering the subfloor space can create a damp environment which encourages timber rot, fungus growth and the potential for termite activity. Subfloor ventilation increases air flow, reducing any damaging water vapour in the subfloor space.

Factors that can affect achieving satisfactory levels of subfloor ventilation include height above ground, prevailing breezes (air transfer), differential temperature and humidity between the subfloor and the external environment and good building practice.

The amount of subfloor ventilation required for a building is related to the relative humidity likely to be encountered in that location. Figure 6.2.1a shows three broad climatic zones based on the prevailing relative humidity and includes a description of the relative humidity conditions which define each zone. If reliable weather data is available, these descriptions may be useful in determining which zone a particular location is in.

The zones shown in Figure 6.2.1a were determined by analysis of the average relative humidity at 9 am and 3 pm in January and July. The season with the highest relative humidity is used. Generally this will be July for southern Australia and January for northern Australia.

Table 6.2.1a and Table 6.2.1b specify the minimum amount of subfloor ventilation openings and height of subfloor framing members above ground level for the three climatic zones illustrated in Figure 6.2.1a. The table allows subfloor ventilation rates to be halved if the ground within the subfloor space is sealed by an impervious membrane because humidity levels in the space will not be affected by moisture from the soil.

Clause 6.2.1(5) specifies additional requirements for preventing deterioration of subfloor members where the ground or subfloor space is excessively damp, as would occur in areas with high water tables, poor drainage or in areas frequently affected by flooding or water inundation.
6.3.1 Application of Part 6.3

(1) Part 6.3, other than clause 6.3.4, applies subject to the limitations set out at H1D6(7).

(2) Part 6.3 need not be complied with if H1D6(6)(a) or (b) are complied with.

6.3.2 Structural steel members

(1) Structural steel members may be used as follows:
   (a) Bearer supporting a timber floor or non-loadbearing stud wall — in accordance with Figure 6.3.2a, Table 6.3.2a and Table 6.3.2b.
   (b) Strutting beams supporting roof and ceiling loads — in accordance with Figure 6.3.2b and Table 6.3.2c to Table 6.3.2d.
   (c) Lintels supporting roof, ceiling, frame and timber floor — in accordance with Figure 6.3.2c and Table 6.3.2e to Table 6.3.2f.
   (d) Columns — in accordance with Section 6.3.3.

(2) Structural steel members in (1)(a), (b) and (c) must have a minimum nominal yield strength of 250 MPa.

(3) The yield strength of structural steel members in (1)(d) is nominated in 6.3.6.

(4) Structural steel members described in this Part must be protected against corrosion in accordance with 6.3.5.

(5) Joists, bearers and lintels must be restrained from lateral movement or twisting along their length by fixing rafters or joists to the top flange of the member so that it prevents that member from moving laterally.

(6) End supports for joists, bearers and lintels must transfer loads to the footings and have a bearing distance as follows:
   (a) For single spans, the bearing distance must not be less than the width of the member.
   (b) For continuous spans, internal bearing must not be less than two times the width of the member.

### Table Notes:
1. **EBS** = Effective bearer spacing (m).
2. Steel is base grade.
3. Load must be evenly distributed along the member.
4. See 6.3.2 for provisions that apply to suspended floors in single-storey and ground floor construction of suspended steel floor frames.
5. Effective bearer spacing is a measure of the width of the load area being supported by the member (for single span members see Table H1D6a and Figure H1D6d).

### Table Notes:
1. **EBS** = Effective bearer spacing (m).
2. Steel is base grade.
3. Load must be evenly distributed along the member.
4. For continuous floor bearers, the variation in span length should not be more than 10%.
5. See 6.3.2 for provisions that apply to suspended floors in single-storey and ground floor construction of suspended steel floor frames.
6. Effective bearer spacing is a measure of the width of the load area being supported by the member (for continuous span members see Table H1D6b and Figure H1D6e).

6.3.3 Bearers

Structural steel bearers must comply with the following:

(a) Effective bearer spacing must be determined in accordance with—
   (i) for single span joists — Table H1D6a and Figure H1D6d; and
   (ii) for continuous span joists — Table H1D6b and Figure H1D6e.

(b) Maximum acceptable bearer spans must be determined in accordance with—
   (i) for single spans — Tables 6.3.3a and; and
   (ii) for continuous spans — Tables 6.3.3b and.

(c) All loads along the bearer must be evenly distributed.

(d) The difference in distance between supports for continuous span bearers must not be more than 10% of the span.

(e) Fixing of joists and columns to structural steel bearers must comply with 6.3.7.

(f) Bearers must be supported by structural steel columns that comply with 6.3.6 and are fixed in accordance with 6.3.7.

6.3.4 Strutting beams

[New for 2022]

Structural steel strutting beams must comply with the following:
(a) Acceptable strutting beam spacing must be determined in accordance with—
   (i) for single span rafters — Table H1D6a and Figure H1D6d; and
   (ii) for continuous span rafters — Table H1D6b and Figure H1D6e.
(b) Maximum acceptable strutting beam spans must be determined in accordance with—
   (i) for metal sheet roofs — Tables 6.3.4a, 6.3.4b, 6.3.4c, 6.3.4d, 6.3.4e or 6.3.4f; and
   (ii) for tiled roofs — Tables 6.3.4g, 6.3.4h, 6.3.4i, 6.3.4j, 6.3.4k or 6.3.4l.
(c) Any point load applied must be located within the middle third of the strutting beam.
(d) Strutting beams must be tied down in accordance with H1D6(3) where supporting metal roofs.
(e) Fixing and any cutting of strutting beams must comply with 6.3.7.
(f) Strutting beams must be supported by structural steel columns that comply with 6.3.6 and be fixed in accordance with 6.3.7.

The text provides information on load combinations, deflections, and beam spans for different load conditions and ceiling types. It includes:

1. Load combinations and wind pressures for different load states (ULS and SLS).
2. Details on strutting beam design, including restraint conditions.
3. Tables listing maximum acceptable combined and counter-strutting beam spans for various sections and ceiling load areas.

Table 6.3.4i: Maximum acceptable combined strutting/hanging beam span — combined strutting/hanging beam supporting tiled roof and gypsum ceiling — roof load area = 12 m²

Table 6.3.4j: Maximum acceptable counter-strutting beam span — counter-strutting beam supporting tiled roof and gypsum ceiling — roof load area = 4 m²
Table Notes:
1. Load accounted for includes 0.2 kPa permanent ceiling, 0.4 kPa permanent roof, permanent member self-weight, 0.25 kPa imposed roof, positive roof wind pressure of 0.95 kPa and negative roof wind pressure of -1.49 kPa.
2. Load combinations included are 1.35G, 1.2G + 1.5Q, 1.2G + W_U + 0.4Q, 0.9G + W_U for ULS and G + 0.7Q, G + W_S for SLS with a maximum deflection of span/300.
3. Strutting beams are assumed to be partially restrained at both ends with no rotational restraint and are designed as members without full lateral restraint.
4. A ceiling load area of “0” must be used for strutting beams not supporting ceiling loads.

Table Notes:
1. Load accounted for includes 0.2 kPa permanent ceiling, 0.4 kPa permanent roof, permanent member self-weight, 0.25 kPa imposed roof, positive roof wind pressure of 0.95 kPa and negative roof wind pressure of -1.49 kPa.
2. Load combinations included are 1.35G, 1.2G + 1.5Q, 1.2G + W_U + 0.4Q, 0.9G + W_U for ULS and G + 0.7Q, G + W_S for SLS with a maximum deflection of span/300.
3. Strutting beams are assumed to be partially restrained at both ends with no rotational restraint and are designed as members without full lateral restraint.
4. A ceiling load area of “0” must be used for strutting beams not supporting ceiling loads.

**Table Notes:**

1. Load accounted for includes 0.2 kPa permanent ceiling, 0.4 kPa permanent roof, permanent member self-weight, 0.25 kPa imposed roof, positive roof wind pressure of 0.95 kPa and negative roof wind pressure of -1.49 kPa.
2. Load combinations included are 1.35G, 1.2G + 1.5Q, 1.2G + Wₚ + 0.4Q, 0.9G + Wₚ for ULS and G + 0.7Q, G + Wₛ for SLS with a maximum deflection of span/300.
3. Strutting beams are assumed to be partially restrained at both ends with no rotational restraint and are designed as members without full lateral restraint.
4. A ceiling load area of “0” must be used for strutting beams not supporting ceiling loads.

### 6.3.5 Lintels

[New for 2022]

Structural steel lintels must comply with the following:

(a) **Acceptable spans for lintels supporting roofs, frames and timber floors must be determined in accordance with—**
   (i) for metal sheet roofs, Tables 6.3.5a, 6.3.5b or 6.3.5c; and
   (ii) for tiled roofs, Table 6.3.5d, 6.3.5e or 6.3.5f.

(b) **Effective load widths for structural steel lintels must be determined in accordance with Figure 6.3.5 option (a) or (b).**

(c) All loads along the structural steel lintel must be evenly distributed.

(d) The top flange of the structural steel lintel must be laterally restrained at the loading points.

(e) Fixing of structural steel lintels must comply with 6.3.7.

(f) Structural steel lintels used in masonry must also comply with H1D5.

(g) Lintel beams must be supported by structural steel columns that comply with 6.3.6.

### Table 6.3.5a: Maximum acceptable lintel span — lintel supporting metal sheet roof, timber floor and 3 m high exterior wall — roof load width = 1.5 m

Table Notes:
1. Load accounted for includes 0.98 kPa permanent floor, 1.16 kN/m permanent wall, 0.85 kPa permanent roof, permanent member self-weight, 1.5 kPa or 1.1 kN imposed floor, positive roof wind pressure of 0.95 kPa and negative roof wind pressure of -1.49 kPa.
2. Load combinations included are 1.35G, 1.2G + 1.5Q, 1.2G + W_1 + 0.4Q, 0.9G + W_2 for ULS G + 0.7Q, G + W_S.
3. 0.9G + W_S for SLS with a maximum deflection of span/200.
4. Lintels are assumed to be partially restrained at both ends with no rotational restraint and are designed as members without full lateral restraint.
5. A floor load of “0” must be used for lintels not supporting floor loads.

Figure 6.3.2c5: Lintels supporting roof, frames and timber floors

Lintels supporting roof and floors

(a) Floor and truss roof

(b) Floor and conventional roof

6.3.36 Columns

[ 2019: 3.4.4.3 ]

(4) Columns may support the area provided for in Table 6.3.3a and Table 6.3.3b provided—
the effective height of the column is determined in accordance with Figure 6.3.3a and Table 6.3.3c; and
the floor area to be supported is determined in accordance with Figure 6.3.3b and Table 6.3.3d; and
the load eccentricity between the centre of the column and the applied vertical loading complies with—

(1) Structural steel columns must comply with the following:
(a) Columns must support the area provided for in—
   (i) Tables 6.3.6a, 6.3.6b and 6.3.6c for columns supporting tiled floor and tiled roof load; and
   (ii) Tables 6.3.6d, 6.3.6e and 6.3.6f for columns supporting timber floor and metal roof load.
(b) The floor area to be supported is to be determined in accordance with Table 6.3.6g and Figure 6.3.6a.
(c) The flooring system supported by structural steel columns must be fully braced to the footing level either by—
   (i) subject to (d), adequately fixing the full height of the column to bracing walls of similar height in the two
   orthogonal directions of the building; or
   (ii) a bracing system designed in accordance with AS 1684.2, AS 1684.3, AS/NZS 4600, NASH standard or
   AS 3700 as appropriate to the materials being used.
(d) For the purposes of (c)(i), the bracing walls must be capable of resisting racking forces in each direction not less
   than a proportion of the building’s racking force equal to the proportion of floor area that the column is supporting
   compared to the total floor area of the building.
(e) Acceptable load eccentricity must not exceed 50% of the cross-sectional width plus 100 mm (see Figure 6.3.6b).

### Table Notes:
Tabulated values are the column sections to be used.

### Table 6.3.3c: Determining effective column height—column height factor (F1)

<table>
<thead>
<tr>
<th>Base detail</th>
<th>Fully-braced construction</th>
<th>Unbraced construction (cantilever columns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cast into footing</td>
<td>1.00</td>
<td>2.60</td>
</tr>
<tr>
<td>Fixed by bolts to footing or slab</td>
<td>1.20</td>
<td>must not be used</td>
</tr>
<tr>
<td>Fixed by intermediate floor or bracing in both directions</td>
<td>1.20</td>
<td>2.60</td>
</tr>
</tbody>
</table>
Table Notes:

1. To determine the column effective height, the actual column height (H) in Figure 6.3.3a must be multiplied by a column height factor (F1) in Table 6.3.3c.

2. \(H = \) Distance measured from the top of footing to underside of supported beam or bearer, or between intermediate lateral bracing points.

3. The flooring system must be fully braced to footing level by—
   a. a combination of column bracing sets, and timber or masonry bracing walls; or
   b. the provision of cantilever steel columns only (i.e. no column bracing sets, timber or masonry bracing walls).

Table Notes:

1. Load accounted for includes 0.98 kPa permanent floor, 1.16 kN/m permanent wall, 0.85 kPa permanent roof, permanent member self-weight, 1.5 kPa or 1.1kN imposed floor and 0.25 kPa imposed roof.

2. Load combinations included are 1.35G and 1.2G + 1.5Q for ULS.

3. Columns are assumed to be simply-supported at both ends with an effective length factor of 1.

4. A maximum load eccentricity of 100 mm has been accounted for in the columns.

5. A roof load area of “0” must be used for columns not supporting roof loads.

6. The length of wall load allowed for is equal to the square root of the floor area.

<td>75 x 75 x 2.5 SHS</td>
</tr>
<tr>
<td>SHS 450</td>
<td>3600</td>
<td>75 x 75 x 2.5 SHS</td>
</tr>
</tbody>
</table>

Table Notes:
1. Load accounted for includes 0.53 kPa permanent floor, 1.16 kN/m permanent wall, 0.4 kPa permanent roof, permanent member self-weight, 1.5 kPa or 1.1kN imposed floor and 0.25 kPa imposed roof.
2. Load combinations included are 1.35G and 1.2G + 1.5Q for ULS.
3. Columns are assumed to be simply-supported at both ends with an effective length factor of 1.
4. A maximum load eccentricity of 100 mm has been accounted for in the columns.
5. A roof load area of “0” must be used for columns not supporting roof loads.
6. The length of wall load allowed for is equal to the square root of the floor area.

Table 6.3.3d: Area supported by columns

<table>
<thead>
<tr>
<th>Column descriptor (as shown in Figure 6.3.6a)</th>
<th>Total area supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1</td>
<td>0.375L1 x 0.375LA</td>
</tr>
<tr>
<td>C2</td>
<td>0.625(L1 + L2) x 0.375LA, 0.7(L1 + L2) x 0.4LA</td>
</tr>
<tr>
<td>C3</td>
<td>0.375L1 x 0.625(LA + LB), 0.4L1 x 0.7(LA + LB)</td>
</tr>
</tbody>
</table>
Table Notes:
The total area supported equations marginally overestimate the total area to account for a difference between L1 and L2 by up to 30%.

1. The total area supported depends on the position of the column in the structure as shown in Figure 6.3.3b.
2. To calculate the correct area supported by a column, match the column’s position with those shown in Figure 6.3.3b, which shows a plan view of a floor and then calculate the total area supported from Table 6.3.3d.

### Column descriptor (as shown in Figure 6.3.6a, Figure 6.3.3b)

0.7(L1 + L2) x 0.7(LA + LB) |
| C5                                                            | 0.375L1 x (L cant + 0.5LC)  
0.4L1 + 0.4LC |
| C6                                                            | 0.625(L1 + L2) x (L cant + 0.5LC)  
0.7(L1 + L2) x 0.4LC |

Figure 6.3.3a: Determining effective column height—Column height (H)

![Determining effective column height—Column height (H)](image)

Figure 6.3.3b: Determining floor area supported by columns

![Determining floor area supported by columns](image)
Explanatory Information: **Cantilever columns**

A cantilever column is not assisted by any lateral bracing element such as a column bracing set, timber or masonry wall.

Explanatory Information: **Calculating column size**

The following is an example of the steps required to calculate a suitable column to support typical floor loads in a residential building. It is proposed the column will—

- have an actual height of 1800 mm; and
- support a timber floor only; and
- be square in section; and
- be cast in to the footings; and
- be fully braced by column bracing sets.

**Step 1 – Determining effective column height**

The column height ($H$) is determined by multiplying the actual height by the relevant height factor ($F_1$) in Tables 6.3.6d, 6.3.6e or 6.3.6f. In this case, the relevant value for $F_1$ is 1.00 as the column is cast in to the footing and is fully braced.
Therefore:

- \( H = \text{actual height} \times F_1 \)
- \( H = 1800 \text{ mm} \times F_1 \)
- \( H = 1800 \text{ mm (1.8 m)} \)

**Step 2 – Determine floor area to be supported**

The column position selected is C4 as shown in Figure 6.3.6b and the dimensions of L1 and L2 are 2700 mm (2.7 m), LA is 1900 mm (1.9 m) and LB is 2100 mm (2.1 m).

The area supported by the column is determined by the formulae set out in Table 6.3.6g.

Therefore:

- \( \text{Total area supported (A)} = 0.625(L_1 + L_2) \times 0.625(L_A + L_B) \)
- \( A = 0.625(2.7 \text{ m} + 2.7 \text{ m}) \times 0.625(1.9 \text{ m} + 2.1 \text{ m}) \)
- \( A = (0.625 \times 5.4 \text{ m}) \times (0.625 \times 4.0 \text{ m}) \)
- \( A = 3.38 \text{ m} \times 2.5 \text{ m} \)
- \( A = 8.5 \text{ m}^2 \)

**Step 3 – Select column size from Tables 6.3.6d, 6.3.6e or 6.3.6f**

The column with an effective height of 1800 mm supporting a floor area of 8.5 m² is selected from the 10 m² column in Table 6.3.6d ("0" roof load area) giving a SHS 350 75 x 75 x 3 size.

It should be noted there is a choice of CHS 250 88.9 x 4 or CHS 350 101.6 x 2.6 should a different section be desired.

### 6.3.7 Fixings and bearing for structural steel members

[New for 2022]

1. All bolts used in connections must be hot dip galvanised 300 g/m².
2. Bearer connections must be fixed in accordance with Figure 6.3.7a.
3. Joists, bearers and lintels must be restrained from lateral movement or twisting along their length by fixing rafters or joists to the top flange of the member so as to prevent the member from moving laterally.
4. End supports for bearers and lintels must transfer loads to the footings and have a bearing distance as follows:
   - (a) For single spans, the bearing distance must be not less than the width of the member.
   - (b) For continuous spans, internal bearing must be not less than two times the width of the member.
5. Strut beams must—
   - (a) be supported and fixed in accordance with Figure 6.3.7b; and
   - (b) where ends are cut to suit roof pitch, be cut in accordance with Figure 6.3.7c.
6. Lintels must be fixed in accordance with Figures 6.3.7d, 6.3.7e, 6.3.7f, 6.3.7g and 6.3.7h.

**Figure 6.3.2a7a:** Bearer supporting a timber floor and non-loadbearing stud wall

Steel lintel  
Timber/steel supports tied down in accordance with 3.4.3
**Figure 6.3.7f:** Typical universal beam to column connection detail

![Diagram of universal beam to column connection](image1.png)

**Figure Notes:**
1. 8 mm steel plates to be welded to the top and bottom of the column using 5 mm fillet welds.
2. Plate width must be the greater of the column width or the beam width.
3. Plate length must be such that there is not less than 40 mm from the centreline of the bolts to the ends.
4. All bolting between structural steel members be not less than 2 M12 4.6/S.

**Figure 6.3.7g:** Typical PFC and RHS beam to column connection detail

![Diagram of PFC and RHS beam to column connection](image2.png)

**Figure Notes:**
Fixing of the column base plate to the slab must be not less than 2 M12 4.6/S post-installed mechanical anchors.
Explanatory Information:
The ends of bearers and lintels must be sufficiently supported to ensure structural loads are transferred to the footing system. The amount of horizontal bearing (measured in millimetres) required on the vertical supports will depend on.
the type of span of the bearer or lintel. For single spans, the amount of horizontal bearing is to be equal to or greater than the width of the bearer or lintel. For continuous spans it is to be twice the width of the bearer or lintel.

**Bearing distance, see 6.3.7(4)(a) and (b).**

Explanatory Figure 6.3.7 below depicts an example of a 200 PFC bearer or lintel supporting floor or roof loads over a single span.

**Figure 6.3.7 (explanatory): Example of a 200 PFC bearer or lintel supporting floor or roof loads over a single span**

\[ D \geq 1 \times w \]
\[ D \geq 1 \times 75\text{mm} \]
\[ D \geq 75\text{mm (bearing distance)} \]

---

**6.3.8 Cuts and penetrations through structural steel members**

New for 2022

Penetrations through structural steel members must be within the allowable zones in Figure 6.3.8.
Figure 6.3.8: Allowable zones for penetrations through structural steel members

Explanatory Information:
Cutting and penetrations in structural steel should be avoided where possible. Figure 6.3.8 provides permissible zones for penetrations through structural steel and for end cuts to beams. However, it is recommended that a suitable qualified professional be consulted where penetrations or cuts are required to be made on site.

6.3.49 Corrosion protection

[2019: 3.4.4.4]

(1) Structural steel members that are not built into a masonry wall must be protected against corrosion in accordance with Table 6.3.4.

(1) Structural steel members that are not built in to a masonry wall must—
(a) be protected against corrosion in accordance with Tables 6.3.9a, 6.3.9b and 6.3.9c; and
(b) where a paint finish is applied to the surface, be free from rust; and
(c) where zinc coatings are applied to the surface, be provided with a barrier coat to prevent domestic enamels from peeling.

Table 6.3.9a: Minimum protective coatings for structural steel members

<table>
<thead>

### Table 6.3.4: Protective coatings for steelwork

<table>
<thead>
<tr>
<th>Environment</th>
<th>Location</th>
<th>Minimum protective coating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moderate Note 1</td>
<td>Internal</td>
<td>No protection required in a permanently dry location Note 8</td>
</tr>
</tbody>
</table>
| Moderate Note 1 | External | Option 1: 2 coats alkyd primer  
Option 2: 2 coats alkyd gloss  
Option 3: Hot dip galvanised 300 g/m² for 1 min  
Option 4: Hot dip galvanised 100 g/m² for 1 min plus either 1 coat solvent based vinyl primer or 1 coat vinyl gloss or alkyd |
| Severe Note 2 | Internal | Option 1: 2 coats alkyd primer  
Option 2: 2 coats alkyd gloss |
| Severe Note 2 | External | Option 1: Inorganic zinc primer plus 2 coats vinyl gloss finishing coats  
Option 2: Hot dip galvanised 300 g/m²  
Option 3: Hot dip galvanised 100 g/m² for 1 min plus either 2 coats solvent based vinyl primer, or 2 coats vinyl gloss or alkyd |

**Table Notes:**

1. **Moderate** = More than 1 km from breaking surf or more than 100 m from salt water not subject to breaking surf or non-heavy industrial areas.
2. **Severe** = Within 1 km from breaking surf or within 100 m of salt water not subject to breaking surf or heavy industrial areas.
3. **Heavy industrial areas** means industrial environments around major industrial complexes.
4. The outer leaf and cavity of an external masonry wall of a building, including walls under open carports are considered to be external environments. A part of an internal leaf of an external masonry wall which is located in the roof space is considered to be in an internal environment.

5. Where a paint finish is applied the surface of the steel, work must be hand or power tool cleaned to remove any rust immediately prior to painting.

6. All zinc coatings (including inorganic zinc) require a barrier coat to stop conventional domestic enamels from peeling.

7. Refer to the paint manufacturer where decorative finishes are required on top of the minimum coating specified in the table for protection of the steel against corrosion.

8. Internal locations subject to moisture, such as in close proximity to kitchen or bathroom exhaust fans are not considered to be in a permanently dry location and protection as specified for external locations is required.

9. For applications outside the scope of this table, seek specialist advice.

Notes:
Clause 3.4.4.4 and Table 3.4.4.7 from NCC Volume Two 2019 (Amendment 1) may be used in place of 6.3.7 and Tables 6.3.9a, 6.3.9b and 6.3.9c until 1 September 2023.

7.4.7 Acceptable dedicated overflow measure per downpipe

Part 7.5 Timber and composite wall cladding

7.5.1 Application of Part 7.5
7.5.2 Timber wall cladding
7.5.3 Wall cladding boards
7.5.4 Sheet wall cladding
7.5.5 Eaves and soffit linings
7.5.6 Flashings to wall openings
7.5.7 Clearance between cladding and ground
7.5.8 Parapet cappings
7.1.1 Scope

(1) This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for—
   (a) metal sheet roofing (see Part 7.2); and
   (b) roof tiles (see Part 7.3); and
   (c) gutters and downpipes (see Part 7.4); and
   (d) timber and composite wall cladding (see Part 7.5).

(2) For other roof and wall cladding provisions not included in this Section of the ABCB Housing Provisions, refer to the following Deemed-to-Satisfy Provisions in NCC Volume Two: metal wall cladding (see H1D7(6)).

Explanatory Information:
This Part contains requirements including weatherproofing and structural requirements, for wall and roof systems. Gutter and downpipe requirements are also contained in this Part.
It should be noted that other construction methods may be used to achieve the same results as specified in this Part provided they comply with the appropriate Performance Requirement.

7.1.2 Application

The application of Section 7 of the ABCB Housing Provisions is subject to the following:
   (a) The Governing Requirements of NCC 2022 Volume Two.
   (b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:
In NCC 2019, the content of Section 7 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.5.1 to 3.5.4 of NCC 2019 Volume Two.
NCC 2019 Volume Two did not include an acceptable construction practice for Part 3.5.5.
7.2.1 Application of Part 7.2

(1) Part 7.2 applies subject to the limitations set out at H1D7(2)(c).
(2) Part 7.2 need not be complied with if H1D7(2)(a) or (b) is complied with.

Explanatory Information: Design wind speeds
Information on design wind speeds for particular areas may be available from the appropriate authority. Also see the table associated with the definition of ‘design wind speed’ for wind classes. A map indicating wind regions of Australia is contained in Part 2.2.

Explanatory Information: Other relevant sheet roof requirements
A number of other Volume Two provisions contain specific requirements relevant to sheet roofing, in addition to the provisions of this Part. They include—
(a) for the sizing and fixing of roof battens—
   (i) H1D6(2) for steel battens; and
   (ii) H1D6(3) for timber battens; and
(b) Housing Provisions Part 9.3 for requirements for roofing over a separating wall; and
(c) Housing Provisions Part 7.4 for gutters and downpipes.

7.2.2 Corrosion protection and compatibility requirements for roofing

(1) Metal sheet roofing must be protected from corrosion in accordance with Table 7.2.2a.
(2) Where different metals are used in a roofing system, including flashings, fasteners, guttering, downpipes, etc., they must be compatible with each other as described in Table 7.2.2b, Table 7.2.2c, Table 7.2.2d, to and Table 7.2.2e and—
   (a) no lead materials can be used upstream from aluminium/zinc coated materials; and
   (b) no lead materials can be used on roofs that form part of a potable (drinking) water catchment area; and
   (c) no copper materials can be used upstream from galvanized coated materials.

Table 7.2.2a: Acceptable corrosion protection for metal sheet roofing

<table>

<td>Z275 galvanised or AZ150 aluminium/zinc or AM100 aluminium/zinc/magnesium</td>
</tr>
</tbody>
</table>
Table Notes:

1. Low — remote inland includes dry rural areas remote from the coast or sources of pollution. Many areas of Australia beyond at least 50 km from the sea are in this category, including most cities and towns such as Canberra, Ballarat, Toowoomba, Alice Springs and some suburbs of cities on sheltered bays such as Melbourne, Hobart, Brisbane and Adelaide that are more than 1 km from the sea. However each of these have many exceptions which are in more corrosive categories.

2. Medium — urban inland, coastal or industrial typically coastal areas with low salinity around sheltered bays, such as Port Phillip Bay. This extends from about 50 m from the shoreline to a distance of about 1 km inland but seasonally or in semi-sheltered bays extends 3 to 6 km inland. Along ocean front areas with breaking surf and significant salt spray, it extends from 1 km inland to about 10 to 50 km depending on wind direction and topography. Much of the metropolitan areas of Wollongong, Sydney, Newcastle, Perth and the Gold Coast are in this category. This can extend to 30 to 70 km inland in South Australia while on some evidence, other southern Australian coastal zones are in this, or a more severe category. This also includes urban and industrial areas with low pollution and for several kilometres around large industries such as steel works and smelters.

3. High typically occurs on the coast around sheltered bays. Category high extends up to 50 m inland from the shoreline. In areas of rough seas and surf it extends from several hundred metres to about 1 km inland. As with other categories the extent depends on wind, wave action and topography. The category will also be found inside industrial plants and can influence a distance of 1.5 km down wind of the plant.

4. Very high is typical of offshore conditions and is found on the beachfront in regions of rough seas and surf beaches. It can extend inland for several hundred metres. It is also found in aggressive industrial areas with a pH of less than 5.

5. All locations described in the table contain variations of greater corrosion severity. If significant, this must be addressed by designing for the most severe environment.

6. In locations where metallic coatings are not a suitable form of corrosion protection, the roof sheeting must be of a type that has been designed and manufactured for such environments.

**Table Notes:**

1. No — means the metal cannot be used in association with the other metal.
2. Yes — means the metal can be used in association with the other metal.

**Explanatory Information:**

To prevent corrosion due to adverse chemical reaction of materials used, 7.2.2(2) ensures that the metal roofing and other materials that come in to contact with it, i.e. fasteners, flashings and cappings, etc. are compatible with each other.

### 7.2.3 Minimum pitches for metal sheet roofing profiles

[2019: 3.5.1.3]

Metal sheet roofing must comply with the minimum pitch requirements for the associated roof profile in accordance with Figure 7.2.3.

**Figure 7.2.3:** Minimum pitch requirements for metal roofing profiles – Roof slope and pitch drainage capacity

- **Corrugated**
  - Minimum pitch – 5 degrees

- **Close pitched trapezoidal**
  - Minimum pitch – 3 degrees

- **Trapezoidal**
  - Minimum pitch – 3 degrees

- **Concealed fastened**
  - Minimum pitch – 1 degree

**Figure Notes:**

1. For minimum end lap requirements see 7.2.6(b)(ii).
2. Consideration should be given to the drainage run off capacity of the roof sheeting when determining the minimum pitch and total length of the roof sheet.
7.2.4 Maximum spans

Metal sheet roofing must comply with the maximum span limitations between roofing supports in accordance with Table 7.2.4 and Figure 7.2.4.

**Table 7.2.4: Maximum roofing spans between supports**

<table>
<thead>
<tr>
<th>Sheet roofing profile</th>
<th>Sheet roofing base metal thickness (mm)</th>
<th>Max. end span (mm) Note 1</th>

<td>2100</td>
</tr>
<tr>
<td>Concealed fasteners — wide sheet</td>
<td>0.48</td>
<td>1800</td>
<td>2100</td>
</tr>
</tbody>
</table>

**Table Notes:**
1. Refer to Figure 7.2.4 for determination of end span and internal spans.
2. Thermal expansion - Maximum sheet run for pierced fixed metal roofing profiles must be not greater than 25 m when measured between the fasteners at the ends of the sheet.

**Figure 7.2.4:** Maximum spans for roofing between supports

**7.2.5 Fixing of metal sheet roofing**

Metal sheet roofing must—
(a) be either fixed through the roofing (crest fastening) or have concealed fasteners; and
(b) be fixed at spacings in accordance with Table 7.2.5; and
(c) use fixings of a compatible metal to the roof in accordance with Tables 7.2.2b to 7.2.2e; and
(d) when using both clipped and pierced fastening systems, employ an anti-capillary feature in the side lap of the sheet (see Figure 7.2.5).

**Table 7.2.5: Fixing requirements for sheet roofing**

<table>
<thead>
<tr>
<th>Sheet roofing profile</th>
<th>Fixing: End span</th>
<th>Fixing: Internal spans</th>
</tr>
</thead>
<tbody>
<tr>
<td>Corrugated</td>
<td>Side lap and every second rib</td>
<td>Side lap and every third rib</td>
</tr>
</tbody>
</table>
Explanatory Information:
An anti-capillary feature in the side lap of the sheet is used to prevent capillary action drawing moisture into the lap and to allow the lap to drain. This can also be achieved by not over tightening the sheet fixing.
Wherever possible, consideration should be given to laying the metal sheet roofing so that the side lap is facing away from prevailing weather.

7.2.6 Installation of roofing sheets

Sheets must be—
(a) laid wherever possible using complete lengths from the fascia to ridge; or
(b) where a complete length cannot be laid—
   (i) each run must be laid from bottom to top before moving on to the next run (see Figure 7.2.6); and
   (ii) the minimum end lap must be—
       (A) for roof slopes above 15 degrees (1:4) – 150 mm; and
       (B) for roof slopes between 5–15 degrees (1:12-1:4) – 200 mm; and
(c) stop ended (i.e. each valley turned up 60 degrees) at the ridge line of each length.
7.2.7  Flashings and cappings

(1) Sheet metal roof flashings and cappings must comply with the following:

(a) Roof flashings and cappings must be purpose made, machine-folded sheet metal sections of material compatible with all up and downstream metal roof covering materials in accordance with 7.2.2(2).

(b) The type of fasteners for flashing and cappings must comply with 7.2.5.

(c) The fastener and fixing frequency for flashings and cappings must comply with Table 7.2.7.

(d) Joints in flashings and cappings must be not less than 75 mm, lapped in the direction of the fall of the roof, and fastened at intervals not more than 40 mm.

(e) Wall and step flashings must be fastened into masonry walls with galvanized or zinc/aluminium sheet metal wedges at each end of each length and at intermediate intervals of not more than 500 mm and must overlap by not less than 75 mm in the direction of flow.

(f) Lead flashings must not be used with prepainted steel or zinc/aluminium steel or on any roof if the roof is part of a potable (drinking) water catchment area.

(g) Anti-capillary breaks must be installed in accordance with Figure 7.2.7a and be—

   (i) for flat surfaces – 10 mm/30 degree fold; and

   (ii) all other surfaces – 10 mm/90 degree or 135 degree fold.

(h) Acceptable flashing configurations are shown in Figure 7.2.7b and Figure 7.2.7c.

(2) Flashing of penetrations must comply with the following:

(a) Collar flashings must permit the total drainage of the area above the penetration.

(b) On completion of installation, the roof structure must be restored to its original strength by installing roof trimmers and soaker supports as necessary.

(c) The type of fasteners for flashings and cappings must comply with 7.2.5.

(d) Lead flashings must not be used with prepainted steel or zinc/aluminium steel or on any roof if the roof is part of a potable drinking water catchment area.

(e) Acceptable flashings for penetrations are shown in Figure 7.2.7d, Figure 7.2.7e and Figure 7.2.7f.

(f) Clearance for heating appliance roof support members must be in accordance with Part 12.4.

7.2.8 Water discharge

[2019: 3.5.1.8]

Where an eaves gutter is provided in accordance with H1D7(4), sheets must overhang the fascia, or end batten where there is no fascia, by not less than 35 mm.
7.3.1 Application of Part 7.3

(1) Part 7.3 applies subject to the limitations set out at H1D7(3)(c).

(2) Part 7.3 need not be complied with if H1D7(3)(a) or (b) is complied with.

### Explanatory Information: Design wind speeds

Information on design wind speeds for particular areas may be available from the [appropriate authority](#). Also see the table associated with the definition of ‘design wind speed’ for wind classes. A map indicating wind regions of Australia is contained in Part 2.2.

### Explanatory Information: Other relevant roof tile requirements

A number of other Volume Two provisions contain specific requirements relevant to roof tiles, in addition to the provisions of this Part. They include—

(a) for the sizing and fixing of roof battens—
   (i) H1D6(2) for steel battens; and
   (ii) H1D6(3) for timber battens; and

(b) Housing Provisions Part 9.3 for requirements for roofing over a *separating wall*; and

(c) Housing Provisions Part 7.4 for gutters and downpipes.

7.3.2 Fixing of roof tiles and ancillaries

[2019: 3.5.2.2]

(1) Roof tiles and hip, ridge, barge and capping tiles must be fixed in accordance with Table 7.3.2 and Figures 7.3.2a to 7.3.2e.

(2) Fixing required by Table 7.3.2 must consist of one or a combination of the following:

   (a) Galvanized clout nails with a minimum diameter of 2.8 mm and of a length so that the nail will penetrate not less than 15 mm into the batten.

   (b) Self embedding head screws of 8-18 gauge and of a length so that the screw will penetrate not less than 15 mm into the batten.

   (c) Purpose made clips of non-ferrous metal, stainless steel or steel protected from corrosion in accordance with Tables 7.2.2a and 7.2.2b.

   (d) Flexible pointing material complying with AS 2050.

7.3.3 Flashing

(1) Flashing for roof tiles must comply with (2) to (7).

(2) Wall and step flashings:
   (a) For masonry or similar walls, flashing must—
      (i) follow the roof line, allowing not less than 75 mm upturn to the wall and a minimum of 150 mm in width and moulded into the tiles; and
      (ii) have a horizontal overflashing, stepped overflashing or raked overflashing built into the masonry leaf or veneer, except that one continuous flashing may be used as both an apron flashing or an overflashing; and
      (iii) have joints overlap the one below by not less than 75 mm in the direction of flow.
   (b) For flashing where the upturn can be fixed to or behind the supporting frame or cladding, it must—
      (i) follow the roof line, allowing not less than 75 mm upturn to the wall and a minimum of 150 mm in width and moulded into the tiles; and
      (ii) be fastened into or behind the wall cladding at each end and at a maximum of 600 mm centres; and
      (iii) have joints overlap the one below by not less than 75 mm in the direction of flow.

(3) Flashing of penetrations must—
   (a) be either collar, apron or other purpose made flashings; and
   (b) have a minimum upturn on the penetration of not less than 75 mm and a minimum of 150 mm in width surrounding the penetration and be moulded into the tiles; and
   (c) permit the total drainage of the area above the penetration.

(4) Joints in flashing must be not less than 75 mm and lapped in the direction of fall of the roof.

(5) Fixings for flashings must be compatible with the flashing material.

(6) Lead flashings must not be used on any roof that is part of a drinking water catchment area.

(7) Acceptable flashing configurations, including typical details for standard, and bedded and pointed valleys, are shown in Figures 7.3.3a to 7.3.3g.
Figure 7.3.3b: Flashing abutting a weatherboard wall or similar cladding

7.3.4 Sarking

Sarking must—

(a) be provided in accordance with Table 7.3.4; and

(b) comply with AS/NZS 4200.1 and be installed with—

(i) each adjoining sheet or roll being—

(A) overlapped not less than 150 mm; or

(B) taped together; and

(ii) sarking fixed to supporting members at not more than 300 mm centres; and

(iii) no sags greater than 40 mm in the sarking.

Table 7.3.4: Sarking requirements for tiled roofs

<table>
<thead>
<tr>
<th>Roof pitch</th>
<th>Maximum rafter/truss top chord length without sarking (mm) Note 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;18°</td>
<td>N/A Note 2</td>
</tr>
<tr>
<td>≥18° &lt;20°</td>
<td>4 500</td>
</tr>
<tr>
<td>≥20° &lt;22°</td>
<td>5 500</td>
</tr>
<tr>
<td>≥22°</td>
<td>6 000</td>
</tr>
</tbody>
</table>

Table Notes:

1. The maximum rafter/truss top chord length is measured from the topmost point of the rafter/truss i.e. the apex downwards. Where the maximum length is exceeded, sarking must be installed over the remainder of the rafter/truss top chord length towards the eave line of the roof, or equivalent where the building has no eaves.

2. All tiled roofs with a pitch less than 18 degrees must be provided with sarking, regardless of rafter/truss chord length.

Explanatory Information:

Where sarking is also provided as reflective insulation for the purpose of energy efficiency, Section 13 of the ABCB Housing Provisions contains required R-Values and the necessary airspaces adjoining the reflective insulation.
7.3.5 Anti-ponding device/board

(1) An anti-ponding device/board must be provided where sarking is installed on—
   (a) roofs with a pitch less than 20°; and
   (b) roofs with no eaves overhang, regardless of the roof pitch.

(2) An anti-ponding device required by (1) must be water resistant and fixed along the eaves line from the top of the fascia back up the rafter with a clearance of approximately 50 mm below the first batten (See Figure 7.3.5).

Figure 7.3.5: Typical installation of anti-ponding device/board

Figure Notes:
1. Sarking is required by 7.3.4.
2. Anti-ponding device is required by 7.3.5.

7.3.6 Water discharge

Where an eaves gutter is provided in accordance with H1D7(4), tiles must overhang the fascia or tiling batten by not less than 35 mm (See Figure 7.3.5).
7.4.1 Application of Part 7.4

(1) Part 7.4 applies subject to the limitations set out at H1D7(5).

(2) Part 7.4 need not be complied with if H1D7(4)(a) is complied with.

Explanatory Information:

1. The requirement to install drainage systems from roofs and sub-soil drains should be confirmed with the appropriate authority. These provisions need only be applied when drainage systems are necessary.

2. Information on drainage requirements outside the allotment can be obtained from the appropriate authority.

3. Where box gutters are proposed to be installed, AS/NZS 3500.3 may be used to calculate minimum sizes, falls and overflow requirements.

4. For Class 10 buildings it may not be necessary to comply with the requirements for removing surface water for a Class 10 building where the Class 10 building is not connected to a Class 1 building. For example, where a Class 10 garage is attached to a Class 1 dwelling, the run-off from the garage would most likely directly impact the dwelling and therefore be required to be removed. However, a garage that is separated by a reasonable distance from the dwelling so as to not have an impact would not necessarily have to comply with the requirements for removal of surface water.

5. The following are a number of other Parts of the ABCB Housing Provisions that contain requirements relative to drainage and roofing in addition to the provisions of this Part—
   a. 7.5.8 for parapet cappings; and
   b. 7.3.6 for water discharge; and
   c. 7.2.7 for flashings and cappings as they relate to penetrations through roofs; and
   d. Part 3.3 for drainage requirements.

Explanatory Information: Design of stormwater drainage systems

Stormwater drainage systems specified in the NCC Volume Two and the ABCB Housing Provisions are not designed to remove all water to an appropriate outfall during exceptionally heavy rain, particularly in tropical areas. Specifically, eaves gutter systems are designed to remove water arising from rainfall events with an annual exceedance probability average recurrence interval of 20 years 5% provided they are not blocked.

Accordingly, it is necessary to design and install the system to incorporate overflow measures so that when overflowing occurs, during a rainfall event with an annual exceedance probability average recurrence interval of up to 100 years 1%, any water is directed away in a manner which ensures it does not pond against, enter or damage the building, even if the stormwater drainage system is blocked.

Insufficient and poorly located downpipes are a frequent cause of poor roof drainage system performance. The installation of downpipes, especially near valley gutters, is designed to ensure rainwater from areas on the roof that have concentrated water flows is adequately removed.

Particular consideration needs to be given to box gutters, valley gutters etc. located above the internal areas of a building. There are several options available to designers using the requirements of NCC Volume Two and the ABCB Housing Provisions. The designer will need to choose an overflow system that will cope with the rainfall intensity for the particular location. Consideration needs to be given to the total capacity of overflow measures on lower level roofs where overflow measures adopted for a higher roof catchment will result in overflow to a lower one. Overflow discharge onto lower roofs may also require consideration of sarking, flashing and other weatherproofing precautions to the lower roof area.

The acceptable overflow measures in Table 7.4.4a and Table 7.4.4b were calculated using the following formulas:
- For continuous slots or rainhead:
\[ Q = CdA\sqrt{2gh} \]

where—

\[ A = \text{Area (m}^2\text{)} \]

\[ Cd = \text{Discharge coefficient} = 0.61 \]

\[ g = \text{Gravity} = 9.81 \text{ m/s}^2 \]

\[ h = \text{Effective head (m)} \]

\[ Q = \text{Flow rate (m}^3\text{/s)} \]

For front face weir, end stop weir, inverted nozzle, front bead or controlled gap:

\[ Q = 0.67Cd b \sqrt{2gh^{1.5}} \]

where—

\[ b = \text{Width (m)} \]

\[ Cd = \text{Discharge coefficient} = 0.63 \]

\[ g = \text{Gravity} = 9.81 \text{ m/s}^2 \]

\[ h = \text{Effective head (m)} \]

\[ Q = \text{Flow rate (m}^3\text{/s)} \]

### 7.4.2 Materials

Gutters, downpipes and flashings must—

(a) be manufactured in accordance with AS/NZS 2179.1 for metal; and

(b) be manufactured in accordance with AS 1273 for UPVC components; and

(c) be compatible with all upstream roofing materials in accordance with \(7.2.2(2)\); and

(d) not contain any lead if used on a roof forming part of a **drinking water** catchment area.

### 7.4.3 Selection of guttering

The size of guttering must—

(a) for eaves gutters, be in accordance with Table 7.4.3a, Table 7.4.3b and Table 7.4.3c; and

(b) for box gutters, be in accordance with AS/NZS 2600.3; and

(c) be suitable to remove rainwater falling at the appropriate 5 minute duration rainfall intensity listed in Table 7.4.3d to Table 7.4.3k as follows—

(i) for eaves gutters — \(20\) year average recurrence interval, \(5\%\) annual exceedance probability; and

(ii) for eaves gutter overflow measures — \(100\) year average recurrence interval, \(1\%\) annual exceedance probability; and

(iii) for box and valley gutters — \(100\) year average recurrence interval.

### Table Notes:
Locations used in this table are based on the nearest Bureau of Meteorology grid cell latitude and longitude to the central Post Office of each city or town.
Explanatory Information:
The cross sectional area referred to in Table 7.4.3b is measured up to the lowest part of the relevant overflow facility including the lower edge of a slot, gutter back, end-stop weir, inverted nozzle, front-face weir or overflow opening in a rainhead.

Explanatory Information: Worked example — determining appropriate overflow measures

The location of a proposed building is in Wollongong, NSW. Using Table 7.4.3e the 5 minute duration rainfall intensity for a 100 year, 1% annual exceedance probability average recurrence interval is 311.08 mm/h. The 5 minute duration rainfall intensities in Table 7.4.4a and Table 7.4.4b are provided in 25 mm/h increments, therefore for the purpose of the worked example 325 mm/h will be used.

Table 7.4.4a and Table 7.4.4b provide required overflow volumes in both litres per second for dedicated overflow measures and litres per second per metre for continuous overflow measures. Extrapolation of the values in these tables can be used to inform a Performance Solution complying with the Governing Requirements of the NCC. Where both dedicated and continuous measures are proposed, Table 7.4.4b can be used to determine the required overflow volume.

1. Multiple overflow measures are proposed to be used with a roof catchment area of 60 m$^2$, incorporating a 10 m eaves gutter.
2. Using Table 7.4.4b for a 325 mm/h 5 minute duration rainfall intensity, the overflow volume in litres per second (L/s) for a roof catchment area of 60 m$^2$ is 5.4 L/s.
3. Select an acceptable dedicated overflow measure from 7.4.7.
   a. The selected dedicated overflow measure is an end-stop weir which provides 0.5 L/s.
   b. One end-stop weir does not achieve the required overflow volume of 5.4 L/s, and additional overflow measures are required to remove the overflow volume.
4. To achieve the required overflow volume a continuous overflow measure is also selected from 7.4.6.
   a. A front face slotted gutter is the selected overflow measure as it provides 0.5 L/s/m.
   b. Taking account of the eaves gutter length (10 m), the combined overflow measures (0.5 L/s for the end-stop weir and 0.5 L/s/m × 10 m) will remove up to 5.5 L/s.
5. The 5.5 L/s capacity provided by the selected overflow measures exceeds the required 5.4 L/s overflow volume.

7.4.4 Installation of gutters

(1) Eaves gutters must be installed with a fall of not less than
   a. installed with a fall of not less than 1:500; and
   b. supported by brackets securely fixed at stop ends and at not more than 1.2 m centres; and
   c. fitted with overflow measures capable of removing the overflow volume specified in Table 7.4.4a and Table 7.4.4b.
   a. 1:500 for eaves gutters, unless fixed to metal fascias; and
   b. 1:100 for box gutters.

(2) Eaves gutters must be—
   a. supported by brackets securely fixed at stop ends and at not more than 1.2 m centres; and
   b. be capable of removing the overflow volume specified in Table 7.4.4a and Table 7.4.4b.

(2) Overflow measures in accordance with 7.4.6 and 7.4.7 are deemed to be capable of removing the overflow volume specified in those provisions.

(3) Where the overflow volume values for ridge-to-gutter lengths in Table 7.4.4a and roof catchment areas in Table 7.4.4b are not stated, interpolation may be used to determine the applicable overflow values.

(4) Valley gutters must on a roof with a pitch—
   a. be installed on a roof with a pitch more than 12.5 degrees; and
   b. have dimensions in accordance with Table 7.4.4c for the relevant rainfall intensity; and
(c) have minimum upturns along the edges of not less than 15 mm; and
(d) have a side angle of not less than 12.5 degrees.

(a) more than 12.5 degrees — must have width of not less than 400 mm and be wide enough to allow the roof covering to overhang not less than 150 mm each side of the gutter; or

(b) not more than 12.5 degrees — must be designed as a box gutter.

The requirement of (1)(c) does not apply to eaves gutters fixed to a verandah or an eave that is greater than 450 mm in width, which—

(a) has no lining; or

(b) is a raked verandah or a raked eave with a lining sloping away from the building.

Explanatory Information: Valley gutters

1. Where roofs have pitches of 12.5 degrees valley gutters may be designed as box gutters in accordance with AS/NZS 3500.3 or as a Performance Solution by a professional engineer or other appropriately qualified person.

2. An example of a valley gutter profile is shown in Explanatory Figure 7.4.4.

Figure 7.4.4 (explanatory): Valley gutter profile

7.4.5 Downpipes – size and installation

[2019: 3.5.3.5]

Downpipes must—

(a) not serve more than 12 m of gutter length for each downpipe; and
(b) be located as close as possible to valley gutters; and
(c) be selected in accordance with the appropriate eaves gutter section as shown in Table 7.4.3a, Table 7.4.3b and Table 7.4.3c.

Explanatory Information:

A maximum 12 m gutter length served by each downpipe is to ensure effective fall and adequate capacity to discharge all water anticipated during a storm having an annual exceedance probability of average recurrence interval of 20 years 5%.

Where a rainhead overflow device is incorporated in the top of the downpipe, its overflow discharge should be directed...
7.4.6 Acceptable continuous overflow measure

[2019: Table 3.5.3.4a]

(1) For a front face slotted gutter with—
   (a) a minimum slot opening area of 1200 mm² per metre of gutter; and
   (b) the lower edge of the slots installed a minimum of 25 mm below the top of the fascia,
the acceptable overflow capacity must be 0.5 L/s/m, constructed in accordance with Figure 7.4.6a.

(2) For a controlled back gap with—
   (a) a permanent minimum 10 mm spacer installed between the gutter back and the fascia; and
   (b) one spacer per bracket, with the spacer not more than 50 mm wide; and
   (c) the back of the gutter installed a minimum of 10 mm below the top of the fascia,
the acceptable overflow capacity must be 1.5 L/s/m, constructed in accordance with Figure 7.4.6b.

(3) For the controlled back gap option, the spacer can be a proprietary clip or bracket that provides the required offset of the gutter from the fascia.

(4) For controlled front bead height with the front bead of the gutter installed a minimum of 10 mm below the top of the fascia, the acceptable overflow capacity is 1.5 L/s/m constructed in accordance with Figure 7.4.6c.

Figure 7.4.6a: Construction of front face slotted gutter

Figure 7.4.6b: Construction of controlled back gap
7.4.6 Acceptable dedicated overflow measure per downpipe

[2019: Table 3.5.3.4b]

(1) For an end-stop weir with—
   (a) a minimum clear width of 100 mm; and
   (b) the weir edge installed a minimum 25 mm below the top of the fascia,
   the acceptable overflow is 0.5 L/s constructed in accordance with Figure 7.4.7a.

(2) An end-stop weir is not suitable where the end-stop abuts a wall.

(3) For an inverted nozzle installed within 500 mm of a gutter high point with—
   (a) a minimum nozzle size of 100 mm × 50 mm positioned lengthways in the gutter; and
   (b) the top of the nozzle installed a minimum of 25 mm below the top of the fascia,
   the acceptable overflow is 1.2 L/s constructed in accordance with Figure 7.4.7b.

(4) For a front face weir with—
   (a) a minimum clear width of 200 mm; and
   (b) a minimum clear height of 20 mm; and
   (c) the weir edge installed a minimum of 25 mm below the top of the fascia,
   the acceptable overflow capacity is 1.0 L/s constructed in accordance with Figure 7.4.7c.

(5) For a rainhead with—
   (a) a 75 mm diameter hole in the outward face of the rainhead; and
   (b) the centreline of the hole positioned 100 mm below the top of the fascia,
   the acceptable overflow capacity is 3.5 L/s constructed in accordance with Figure 7.4.7d.

(6) The rainhead should be detailed to avoid nuisance discharge from the overflow at rainfall intensities below the normal design level.

Figure 7.4.7c: Construction of front face weir

Figure 7.4.7d: Construction of rainhead
7.5.1 Application of Part 7.5

(1) Compliance with Part 7.5 for wall cladding is achieved if—
   (a) it is installed in accordance with—
       (i) 7.5.2 for timber cladding, including weatherboards and profiled boards; and
       (ii) 7.5.3 for fibre-cement and hardboard wall cladding boards; and
       (iii) 7.5.4 for fibre-cement, hardboard and plywood sheet wall cladding; and
   (b) fibre-cement sheet eaves where provided, are installed in accordance with 7.5.5; and
   (c) openings and penetrations in cladding are flashed in accordance with 7.5.6; and
   (d) the bottom surface of the cladding terminates in accordance with 7.5.7; and
   (e) parapets, where provided, are flashed in accordance with 7.5.8.

(2) Part 7.5 need not be complied with if H1D7(6)(a) is complied with.

Explanatory Information: Masonry wall cladding
Masonry wall cladding, including masonry veneer, is not covered by this Part but is covered by H1D5 and Section 5 of the ABCB Housing Provisions.

Explanatory Information: Alternative wall cladding materials and systems
The provisions of this Part and those of H1D5 and Section 5 (Masonry) of the ABCB Housing Provisions do not cover all of the wall cladding materials that may be used for a Class 1 or Class 10 building.

Wall cladding materials and systems not covered by the Deemed-to-Satisfy Provisions may be considered under a Performance Solution that complies with the relevant Performance Requirements.

One of the Assessment Methods that may be used to demonstrate compliance with the Performance Requirements is the use of documentary evidence in accordance with Part A5.

7.5.2 Timber wall cladding

(1) Timber wall cladding must be installed in accordance with (2), (3), (4) and (5).

(2) Splayed timber weatherboards must be fixed in accordance with Figure 7.5.2a and Figure 7.5.2b and with a lap not less than—
   (a) 30 mm for hardwood, Cypress and treated pine; and
   (b) 20 mm for Western Red Cedar; and
   (c) 25 mm for Baltic Pine.

(3) Profiled timber boards must be—
   (a) fixed in a horizontal, vertical or diagonal direction with the overlap and groove closely fitted, where provided; and
   (b) with tongue and groove profile, fixed with tongue edge up, where they are fixed in a horizontal or diagonal direction; and
   (c) where fixed in a vertical or diagonal direction, provided with a vapour permeable sarking complying with AS/NZS 4200.1 (see Figure 7.5.2c) installed behind boards with—
(i) each adjoining sheet or roll being—
   (A) overlapped not less than 150 mm; or
   (B) taped together; and

(i) sarking fixed to supporting members at not more than 300 mm centres.

(4) Splayed and profiled timber weatherboards must be fixed in accordance with Table 7.5.2, with—
   (a) one fixing at each stud or equivalent framing member for splayed timber weatherboards; and
   (b) one fixing provided at each stud or equivalent framing member for profiled timber boards not more than 130 mm wide; and
   (c) two fixings provided at each stud or equivalent framing member for profiled timber board more than 130 mm wide; and
   (d) fixings located so that the fixing does not penetrate the tip or thinner edge of the board beneath.

(5) Fixings used for timber cladding must comply with the following:
   (a) Where fixings are punched or countersunk and filled prior to painting, fixings must be standard steel flat head nails or standard steel self embedding head screws.
   (b) Uncoated copper or steel fixings must not be used for Western Red Cedar (silicon bronze, monel metal, stainless steel or hot-dipped galvanised are suitable).
   (c) Where the building is located within 200 m of breaking surf, fixings must be—
      (i) stainless steel when fixed into timber framing members; or
      (ii) hot-dipped galvanized (min 600 g/m²) when fixed into steel framing members.
   (d) In all other cases, fixings must be hot-dipped galvanised (min 600 g/m²) flat head nails or hot dipped galvanised (min 600 g/m²) self embedding head or wafer head screws.

</tr>
</tbody>
</table>

**Table Notes:**
1. G = galvanised plain shank, threaded or equivalent nails.
2. S = self embedding head or wafer head screw.
3. Fasteners must penetrate not less than 30 mm into timber frames and not less than two full screw threads through steel frames.
4. Wall cladding may be fixed through timber or metal battens attached to the wall frame in accordance with AS 1684.2, AS 1684.3, AS 1684.4 or NASH standard as appropriate (see fixing requirements for roof battens) so long as the minimum penetration into the wall frame is achieved.
5. Steel framing members must have a base metal thickness (BMT) not less than 1.2 mm that required for a roof batten in NASH standard.

Explanatory Information: Fixing of wall cladding
7.5.2(4)(d) ensures the fixing of the wall cladding does not split the wall cladding board below. For example, for a 30 mm lap, fix 35 mm from the butt or 5 mm above the corresponding overlapping board (see Figure 7.5.2a).

Explanatory Information: Timber cladding profiles
7.5.2 covers the following types of timber cladding profiles:
- Horizontal bevel-back.
- Horizontal rebated bevel-back.
- Horizontal rusticated.
- Vertical and horizontal shiplap.
- Tongue and groove.

Explanatory Information: Machine and hand driven nails
Table 7.5.2 applies to both machine and hand driven nails.

7.5.3 Wall cladding boards

Wall cladding boards must—
(a) for 7.5 mm (minimum) thick fibre-cement — comply with AS/NZS 2908.2 or ISO 8336; and
(b) for 9.5 mm (minimum) thick hardboard — comply with AS/NZS 1859.4 for exterior grade; and
(c) be fixed in accordance with Table 7.5.3a and Table 7.5.3b with—
   (i) one fixing provided at each stud or equivalent framing member for wall cladding boards not more than 130 mm wide; and
   (ii) two fixings provided at each stud or equivalent framing member for wall cladding boards greater than 130 mm wide.
mm wide; and
(iii) fixings located along the studs at not more than 100 mm centres; and
(iv) fixings located so that they do not penetrate the tip or thinner edge of the board beneath; and
(d) have a lap not less than—
(i) for 7.5 mm (minimum) thick fibre-cement — 25mm; or
(ii) for 9.5 mm (minimum) thick hardboard — 20 mm.

Table 7.5.3a: Fixing requirements—Minimum 7.5 mm thick fibre-cement wall cladding boards

</tbody>
</table>

Table Notes:
1. GC = galvanised fibre-cement nail.
2. S = self embedding or wafer head screw.
3. Fasteners must penetrate not less than 30 mm into timber frames and not less than two full screw threads through steel frames.
4. Steel framing members must have a base metal thickness (BMT) not less than \(1.2\) mm that required for a roof batten in NASH standard.
5. Wall cladding may be fixed through timber or metal battens attached to the wall frame in accordance with AS 1684.2, AS 1684.3, AS 1684.4 or NASH standard as appropriate (see fixing requirements for roof battens) so long as the minimum penetration into the wall frame is achieved.

Table 7.5.3b: Fixing requirements—Minimum 9.5 mm thick hardboard wall cladding boards

<table>
<thead>
<tr>
<th>Design wind speed</th>

</tr>
<tr>
<td></td>
<td></td>
<td>Steel: (8-18) S</td>
</tr>
</tbody>
</table>

Table Notes:
1. GC = galvanised fibre-cement nail.
2. S = self embedding or wafer head screw.
3. Fasteners must penetrate not less than 30 mm into timber frames and not less than two full screw threads through steel frames.
4. Steel framing members must have a base metal thickness (BMT) not less than \(1.2\) mm that required for a roof batten in NASH standard.
5. Wall cladding may be fixed through timber or metal battens attached to the wall frame in accordance with AS 1684.2, AS 1684.3, AS 1684.4 or NASH standard as appropriate (see fixing requirements for roof battens) so long as the minimum penetration into the wall frame is achieved.

Explanatory Information:
Where the wall cladding boards contain a shiplap join as opposed to a lapped join, 7.5.3(d) does not apply, and the joins between the boards are required to have the overlap and groove closely fitted.

7.5.4 Sheet wall cladding

(1) Fibre-cement sheet wall cladding must—
Roof and wall cladding

(a) comply with AS/NZS 2908.2 or ISO 8336; and
(b) be fixed in accordance with Table 7.5.4a.

(2) Hardboard sheet wall cladding must—
(a) comply with AS/NZS 1859.4 for exterior grade; and
(b) be fixed in accordance with Table 7.5.4b.

(3) Structural plywood wall cladding must—
(a) comply with AS/NZS 2269.0; and
(b) be fixed in accordance with Table 7.5.4c.

Table 7.5.4a: Stud and fixing spacings for 6 mm fibre-cement sheet wall cladding

Table Notes:
1. Maximum nail spacing using 2.8 mm or 3.5 mm galvanised clouts or flat head nails.
2. Fixings must be positioned a minimum of 12 mm from the edge of the sheet and not less than 50 mm from the edge of all corners.
3. Fasteners must penetrate not less than 30 mm into the timber frame.
4. Wall cladding may be fixed through timber or metal battens attached to the wall frame in accordance with AS 1684.2, AS 1684.3, AS 1684.4 or NASH standard as appropriate (see fixing requirements for roof battens) so long as the minimum penetration into the wall frame is achieved.

Explanatory Information:
Where sheet bracing is also acting as structural bracing, fixing requirements are listed in AS 1684 and NASH Standard – Residential and Low-Rise Steel Framing, Part 2.

7.5.5 Eaves and soffit linings

Where provided, external fibre-cement sheets and linings used as eaves and soffit linings must—

(a) comply with AS/NZS 2908.2 or ISO 8336; and
(b) be fixed in accordance with Table 7.5.5 and Figure 7.5.5 using—
   (i) 2.8 × 30 mm fibre-cement nails; or
   (ii) No. 8 wafer head screws (for 4.5 mm and 6 mm sheets only); or
   (iii) No. 8 self embedding head screws (for 6 mm sheets only).

7.5.6 Flashings to wall openings

Openings in external wall cladding exposed to the weather must be flashed with materials complying with AS/NZS 2904 and in accordance with the following:

(a) Flashings must be provided to bottom, tops and sides of openings, except as permitted by (d), and must be installed so that the flashing—
   (i) extends not less than 110 mm beyond the reveals on each side of the opening where practicable; and
   (ii) is attached to the window and wall framing; and
   (iii) at the top and bottom of the opening, drains to the outside face of the wall or cladding.

(b) Joins in the flashing must—
   (i) overlap by not less than 75 mm in the direction of flow; and
   (ii) be securely fastened at intervals of not more than 40 mm; and
   (iii) have sealant installed between laps.

(c) The method of flashing must be suitable for the framing and cladding used and any reveal for the window or door system or any architrave or finishing trims that may be installed.

(d) The top of an opening need not be flashed where it is adequately protected by an eave of a width more than 3 times the height of the cladding above the opening (See Figure 7.5.6).

(e) Flashings must be securely fixed at least 25 mm under the cladding and extend over the ends and edges of the framing of the opening.
Explanatory Information:

7.5.6(a)(i) applies ‘where practicable’ because it is often impractical to extend the flashing 110 mm beyond the reveal; for example, where openings are positioned adjacent to a corner or where two windows are within 110 mm of each other. In such cases consideration should be given to ensure the flashing prevents the penetration of water into the external wall.

7.5.7 Clearance between cladding and ground

[2019: 3.5.4.7]

(1) The minimum clearance from the bottom of the wall cladding to the adjoining finished ground level must be—

(a) 100 mm in low rainfall intensity areas or sandy, well-drained areas; or

(b) 50 mm above impermeable (paved or concreted) areas that slope away from the building in accordance with 3.3.3(a); or

(c) 150 mm in any other case.

(2) Wall cladding must extend a minimum of 50 mm below the bearer or lowest horizontal part of the suspended floor framing.
Explanatory Information:
The 7.5.7 clearances may also be subject to other requirements for drainage in Part 3.3, clearances for inspection zones for termite management in Part 3.4 and screening and sealing of gap requirements for construction in bushfire prone areas in H7D4, where appropriate.

7.5.8 Parapet cappings

[2019: 3.5.4.8]

Where a wall cladding is used to form a parapet wall, the cladding must be attached to a supporting frame and have a capping installed that complies with the following:

(a) Cappings must—
   (i) be purpose made, machine-folded sheet metal or equivalent sections of a material compatible with all up and downstream metal roof covering materials in accordance with 7.2.2(2); and
   (ii) extend not less than 50 mm down the sides of the parapet; and
   (iii) be separated from the supporting framing by a vapour permeable sarking installed in accordance with (f); and
   (iv) be fixed with either self drilling screws or rivets with rubber washers at intervals of not more than 500 mm that do not penetrate the top of cappings, except at joints and corners.

(b) The top of the capping must slope a minimum of 5 degrees.

(c) Joints in cappings must—
   (i) overlap by not less than 50 mm in the direction of flow; and
   (ii) be securely fastened at intervals of not more than 40 mm; and
   (iii) have sealant installed between laps.

(d) Fixing for cappings must be compatible with the capping material.

(e) Lead cappings must not be used with prepainted steel or zinc/aluminium steel or on any roof if the roof is part of a potable (drinking) water catchment area.

(f) Sarking must comply with AS/NZS 4200.1 and be installed behind all wall cladding where parapets are installed, with—
   (i) each adjoining sheet or roll being—
      (A) overlapped not less than 150 mm; or
      (B) taped together; and
   (i) sarking fixed to supporting members at not more than 300 mm centres.

Explanatory Information:
For the purposes of 7.5.8(f), sarking is required to be installed to the whole external wall which contains the parapet and extend to the top and back of the parapet. A gap should be provided between the sarking and the parapet capping to help control condensation.
### 8 Glazing

#### Part 8.1 Scope and application of Section 8
- **8.1.1** Scope
- **8.1.2** Application

#### Part 8.2 Glazing Windows and external glazed doors
- **8.2.1** Application of Part 8.2
- **8.2.2** Glazing sizes and installation
- **8.2.2** Installation of windows
- **8.2.3** Fully framed glazing installed in perimeter of buildings
- **8.2.3** Fixings
- **8.2.4** Number of fixings
- **8.2.5** Flashings

#### Part 8.3 Glass
- **8.3.1** Application of Part 8.3
- **8.3.2** Glazing sizes and installation
- **8.3.3** Fully framed glazing installed in perimeter of buildings

#### Part 8.4 Human impact safety requirements for glazing Glazing human impact
- **8.4.1** Application of Part 8.4
- **8.4.2** Doors
- **8.3.3** Door side panels
- **8.3.3** Full height framed glazed panels
- **8.3.5** Glazed panels, other than doors or side panels, on the perimeter of rooms
- **8.3.6** Bathroom, ensuite and spa room and splash-black glazing
- **8.3.7** Visibility of glazing
- **8.4.8** Identification of safety glass
8.1.1  Scope

This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for—

(a)  glazing windows and external glazed doors (see Part 8.2); and

(b)  glass (see Part 8.3); and

(c)  human impact safety requirements for glazing (see Part 8.4 Part 8.3).

Explanatory Information:

These provisions relate to the design, manufacture and installation of windows in external walls and the use of glass in Class 1 and 10 buildings. The selection of glass in Part 8.3 applies to other assemblies that may not be in an external wall of a Class 1 or 10 building.

The terms windows and glazed assemblies are used throughout Section 8. The term window is defined in the NCC and relates to a device which is capable of transmitting natural light directly from outside a building or room when it is in the closed position. This is distinct from glazed assemblies which may also include elements located in internal parts of a building. These may be glazed panels, splash-backs, mirrors, shower screens or window-type assemblies that are not subject to wind loads and weatherproofing requirements.

A number of other parts of NCC Volume Two and the ABCB Housing Provisions also contain requirements relating to glazing in addition to this Part. They include:

- H1D5 and Part 5.2 of the ABCB Housing Provisions for flashing material requirements.
- H7D2 for glazed barriers for swimming pool enclosures.
- H7D4 for windows in buildings in designated bushfire prone areas.
- Part 13.3 of the ABCB Housing Provisions for glazing subject to energy efficiency requirements.

8.1.2  Application

The application of Section 8 of the ABCB Housing Provisions is subject to the following:

(a)  The Governing Requirements of NCC 2022 Volume Two.

(b)  The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:

In NCC 2019, the content of Section 8 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practice for Part 3.6 of NCC 2019 Volume Two.
8.2.1 Application of Part 8.2

(1) Part 8.2 applies subject to the limitations set out at H1D8(3), H1D8(1) and (2).

(2) Part 8.2 need not be complied with if H1D8(1) or (2) H1D8(2)(a) is complied with.

(3) Glazed assemblies subject to this Part must comply with—
   (a) 8.2.2 for the installation of windows; and
   (b) 8.2.3 for fixings; and
   (c) 8.2.4 for the number of fixings; and
   (d) 8.2.5 for flashings.

Explanatory Information:
This Part applies to the selection of glass only and does not include the installation of windows or framed glazed doors. This is due to window systems relying on the design and testing of structural system members to withstand wind loads (e.g. mullions, transom, and meeting rails and stiles) and the perimeter frame design, sealants and gaskets to resist water penetration.

This Part does not cover the installation of assemblies that are internal or revolving doors, fixed louvres, skylights, rooflights and windows not installed in the vertical plane, windows in greenhouses or horticultural buildings or frameless sliding doors.

The term ‘one piece framing’ in H1D8(1)(d) generally refers to glazing installed in the external wall of a building where the external fabric is forming the frame.

8.2.2 Glazing sizes and installation

Glazing used in buildings must comply with the following:
   (a) Glazing used in the perimeter of buildings and supported on all sides must comply with the appropriate provisions listed in 8.2.3.
   (b) Glazing used in areas where the potential for human impact could occur must comply with the appropriate provisions listed in 8.3.1.
   (c) For 3 mm monolithic annealed glass, the maximum area must not be more than 0.85 m².
   (d) For 3 mm annealed glass used in Insulated Glass Units (IGU), the maximum area must not be more than 1.36 m².
   (e) All exposed edges must have sharp edges removed.

Explanatory Information:
An Insulated Glass Unit consists of two or more panes of glass spaced apart and factory sealed with dry air or special gases in the cavity. The term is often abbreviated to IGU.

The selection of glass thickness relies not just on limit state wind loads but on a number of geometric criteria that include the influence of aspect ratio and slenderness factors. These factors are taken into account in Tables 8.2.3a, 8.2.3b and 8.2.3c.
8.2.2 Installation of windows

Windows must be installed in accordance with the following:

(a) Window assemblies are to be fixed in accordance with 8.2.3 and 8.2.4.
(b) Structural building loads must not be transferred to the window assembly.
(c) A minimum 10 mm gap must be provided between the top of the window assembly and any loadbearing framing or masonry wall element.
(d) The requirements of (c) may be increased where necessary to allow for frame settlement over wide openings.
(e) Gaps between the window assembly and the adjoining walls, sills or heads must be sealed with a flexible material to prevent the ingress of water.
(f) Packing, if provided between each window assembly and the frame, must be—
   (i) located along each side and bottom; and
   (ii) fixed to ensure the sides and bottom of the window assembly remain straight; and
   (iii) clear of any flashing material.
(g) Where aluminium sills may come into contact with masonry, they must be separated to prevent corrosion.
(h) Window assemblies must be flashed in accordance with 8.2.5.

Explanatory Information:

It is important for windows to be fixed correctly in the external frame or wall of a building to prevent buckling, diagonal distortion or twisting that may compromise weathertightness around the perimeter of the opening. Correct installation is also critical to ensure windows resist design wind pressures that the external walls of the building are subject to over its expected life. Consideration should be given to any additional details for systems designed specifically to meet acoustic or energy efficiency requirements.

Window assemblies should be installed so they are as close as possible to being perpendicular with the vertical and horizontal planes and where all corners form right angles, have equal distances when measured diagonally to ensure they are square.

A gap provided between the top of the assembly and the external wall frame will allow for settlement after construction and prevent the transfer of structural loads. Where packing is used between the openings in the external wall and the window assembly, it should be of a material that is compatible with both the frame and the window assembly. It should also be positioned and fixed to stay in place permanently and ensure the sides and sills remain straight.

Where aluminium sills of a window assembly may contact masonry, particularly mortar, an isolating material such as bituminous membranes or paints and caulking compounds containing zinc chromates should be used. Care must be taken to minimise any gaps between sills and external skins to prevent excessive ingress of water.

Explanatory Figure 8.2.2 provide guidance on the installation of windows and positioning of relevant fixing points.
**8.2.3 Fully framed glazing installed in perimeter of buildings**

Fully framed (supported on all sides) ordinary annealed glass (including annealed patterned glass) installed in the perimeter of buildings must comply with—

(a) if the building is located in an area with a wind class not exceeding N1—Table 8.2.3a; or

(b) if the building is located in an area with a wind class not exceeding N2—Table 8.2.3b; or

(c) if the building is located in an area with a wind class not exceeding N3—Table 8.2.3c.

</table>
8.2.3 Fixings

Fixings used in 8.2.4 must be—

(a) positioned as evenly as practicable around the window assembly; and

(b) at a distance from the edge of framing, brick or block masonry that is not less than five times their shaft diameter, and if fitted into—

(i) timber or masonry walls, be embedded into the frame to a minimum of ten times the diameter of the fixing; and

(ii) lightweight steel frames, be positioned in accordance with NASH Standard Part 2; and

(c) galvanised plain shank, threaded or equivalent nails or self embedding head or wafer head screws; and

(d) where the building is located within 200 m of breaking surf—

(i) for nails, stainless steel when fixed into timber members; or

(ii) in all other cases, hot-dipped galvanised (min. 350 g/m²) nails or hot-dipped galvanised (min. 350 g/m²) selfembedding head or wafer head screws.

Explanatory Information: Edge distance of fixings

The edge distance of fixings can be calculated using the following formula:

\[ e \geq 5D \]

Where—

- \( e \) = distance from the edge of timber frame or masonry wall member
- \( D \) = diameter of main shaft of nail or screw.

For example, for a window using 7 mm masonry screw (anchor) into a masonry wall element:

\[ e \geq 5 \times 7 \text{ mm} \]

therefore, \( e \geq 35 \text{ mm} \), as depicted in Explanatory Figure 8.2.3a, where the distance from the edge of the masonry wall element the fixing is being placed into must be at least 35 mm. This distance can be from either of the edges of the masonry wall element to suit the width of the window assembly frame.
Figure 8.2.3a (explanatory): Example of 7 mm masonry screw into masonry wall element

Explanatory Information: **Embedment**

The embedment depth of fixings to comply with 8.2.3(b)(i) can be calculated using the following formula:

\[ E \geq 10D \]

where—

- \( E \) = embedment
8.2.3 Public Comment Draft
Glazing

- = diameter of nail or screw
For example, for a window using 2.8 mm diameter nails into a timber frame—

\[ E \geq 10 \times 2.8 \]

therefore, \( E \geq 28 \text{ mm} \), as depicted in Explanatory Figure 8.2.3b.

The embedment of the 2.8 mm nails into the timber jamb studs forming the framed opening of the window will need to be a minimum of 28 mm. The nail length will need to be established giving consideration to the calculated embedment depth, thickness of the window assembly jambs and the distance between the timber jamb stud and the window jamb after packing.

**Figure 8.2.3b (explanatory): Example of window using 2.8 mm nails into a timber frame**

---

### 8.2.4 Number of fixings

(New for 2022)

The minimum number fixings for windows must comply with, if the building is in an area with a wind speed not exceeding—

(a) \( N1 \) — Tables 8.2.4a, 8.2.4b or 8.2.4c; or

(b) \( N2 \) — Tables 8.2.4d, 8.2.4e or 8.2.4f; or

(c) \( N3 \) — Tables 8.2.4g, 8.2.4h or 8.2.4i.

Table Notes:
Where the entire window is more than 1200 mm away from any corner of the building, the number of fixings may be reduced by 40%.

Explanatory Information: Intent
The intent of Tables 8.2.4a to 8.2.4i is to provide the number of fixings required for different sizes of windows in varying external wall types for wind classes N1, N2 and N3.

Explanatory Information: Number of fixings
The number of fixings set out in Tables 8.2.4a to 8.2.4i refer to the number for each window rather than for each side, top and bottom face.

The number of fixings per window is dependent on the wind classification of the site, Ultimate Limit State (ULS) wind pressure set out in AS 4055, window dimensions and diameter of fixings. AS 4055 has higher ULS wind pressures for parts of external walls within 1200 mm of external corners. The number of fixings in the tables are based on these higher ULS wind pressures and can be used for windows in the general length of walls and where 25% or more of the width of a single panel of a window is within 1200 mm of an external corner.

Explanatory Information: Size of fixings
For each wind classification, Tables 8.2.4a to 8.2.4i provide the minimum number of 2.8 mm nail and 10 gauge screw fixings for windows. These sizes have been included as they represent a common range of fixings used in residential construction however, larger or smaller fixings can also be used. Where the diameter sizes selected are greater than those included in the tables, their use is still permissible under this Part and will result in a conservative solution.

In cases where windows are to be fixed to masonry walls, installers should refer to masonry insert manufacturers’ documentation.

Where diameter sizes selected are less than those included in the tables, they will be required to demonstrate compliance with the relevant Performance Requirements. The Performance Solution used can be achieved by using one or a combination of the Assessment Methods in A2G2.

8.2.5 Flashings

Windows in external walls must—
(a) be flashed in accordance with 5.2.8(3) and 7.5.6; and
(b) for masonry veneer, comply with Figures 8.2.5a and 8.2.5b; and
(c) for cavity masonry, comply with Figures 8.2.5c and 8.2.5d; and
(d) for walls clad in accordance with Part 7.5, comply with Figures 8.2.5e and 8.2.5f.

Public Comment Draft
Glazing
Figure Notes:
Flashing to be in accordance with 8.2.5.
8.3.1 Application of Part 8.3

(1) The thickness and type of glazing installed in areas of a building that have a high potential for human impact (an area of a building frequented by the occupants during everyday activities in which a person could fall into or against the glazed panel) must comply as follows:

(a) **Doors** — in accordance with 8.3.2.

(b) **Door side panels** — in accordance with 8.3.3.

(c) **Full height glass panels** — in accordance with 8.3.4.

(d) **Glazed panels, other than doors or side panels, on the perimeter of rooms** — in accordance with 8.3.5.

(e) **Bathrooms, ensuite and spa room glazing** — in accordance with 8.3.6.

(f) **Visibility of glazing** — in accordance with 8.3.7.

(2) **Glazing must comply with the following**:

(a) 8.3.2 for glass sizes and installation.

(b) 8.3.3 for fully framed glazing installed in the perimeter of buildings.

(c) Part 8.4 for glazed assemblies subject to human impact.

(d) **Glass used must be of a type within the scope of AS 1288.**

(e) Glass used in barriers, except a **window** serving as a barrier, must withstand loading forces in accordance with AS 1170.1.

(f) **Safety glass must be**—

   (i) **legibly marked in accordance with 8.4.7,** and

   (ii) **made visible in accordance with 8.4.8.**

Explanatory Information:

1. **This Part applies to the selection of glass only and does not include the installation of windows or framed glazed doors.** This is due to window systems relying on the design and testing of structural members to withstand wind loads (e.g. mullions, transoms, and meeting rails and stiles) and the perimeter frame design, sealants and gaskets to resist water penetration.

2. **This Part does not cover glazing in assemblies that are constructed on site and are architectural one-off windows which are not design tested in accordance with AS 2047 or other assemblies that are second-hand, reused, recycled or heritage.**

3. **Information on design wind speed for particular areas may be available from the appropriate authority.**

4. **For glazing in high wind areas, refer to Part 2.2.**

8.3.2 Glazing sizes and installation

Glazing used in buildings must comply with the following:

(a) **Glazing used in the perimeter of buildings** and supported on all sides must comply with the appropriate provisions listed in 8.2.3.3.

(b) **Glazing used in areas where the potential for human impact could occur** must comply with the appropriate provisions listed in 8.3.4 Part 8.4.

(c) **For 3 mm monolithic annealed glass, the maximum area must not be more than 0.85 m².**
(d) For 3 mm annealed glass used in Insulated Glass Units (IGU), the maximum area must not be more than 1.36 m².

(e) All exposed edges must have sharp edges removed.

Explanatory Information:
An Insulated Glass Unit consists of two or more panes of glass spaced apart and factory sealed with dry air or special gases in the cavity. The term is often abbreviated to IGU.

The selection of glass thickness relies not just on limit state wind loads but on a number of geometric criteria that include the influence of aspect ratio and slenderness factors. These factors are taken into account in Tables 8.2.3a, 8.2.3b and 8.2.3c, Tables 8.3.3a, 8.3.3b and 8.3.3c.

8.2.3.3 Fully framed glazing installed in perimeter of buildings

[2019: 3.6.3]

Fully framed (supported on all sides) ordinary monolithic annealed glass (including annealed patterned glass) installed in the perimeter of buildings must comply with—

(a) if the building is located in an area with a wind class not exceeding N1 – Table 8.3.3a, Table 8.2.3a, or Table 8.3.3a;

(b) if the building is located in an area with a wind class not exceeding N2 – Table 8.3.3b, Table 8.2.3b, or Table 8.3.3b;

(c) if the building is located in an area with a wind class not exceeding N3 – Table 8.3.3c, Table 8.2.3c.

</table>
Explanatory Information:

1. For other types of perimeter glazing including toughened, wired, laminated and unframed glazing and insulated glass units, refer to AS 1288.

2. For ordinary monolithic annealed patterned glass thickness measurement refer to AS 1288.

3. The thickness of glass in Tables 8.3.3a, 8.3.3b and 8.3.3c is dependent on the wind classification of the site, Ultimate Limit State (ULS) wind pressure set out in AS 4055, and the dimensions of the glass panel. AS 4055 has higher ULS wind pressures for parts of external walls within 1200 mm of external corners. The thickness of glass in Tables 8.3.3a, 8.3.3b and 8.3.3c is based on these higher ULS wind pressures and can also be used for glass in the general length of walls.
8.4.1 Application of Part 8.4

(1) Part 8.4 applies subject to the limitations set out at H1D8(1).

(2) Part 8.4 need not be complied with if H1D8(4)(a) is complied with.

(3) The thickness and type of glazing installed in areas of a building that have a high potential for human impact (an area of a building frequented by the occupants during everyday activities in which a person could fall into or against the glazed panel) must comply as follows:

(a) Door — in accordance with 8.4.2.

(b) Door side panels — in accordance with 8.4.3.

(c) Full height glass panels — in accordance with 8.4.4.

(d) Glazed panels, other than doors or side panels, on the perimeter of rooms — in accordance with 8.4.5.

(e) Bathrooms, ensuite and spa room glazing — in accordance with 8.4.6.

(f) Visibility of glazing — in accordance with 8.4.7.

(g) Identification of safety glass — in accordance with 8.4.8.

8.3.24.2 Doors

[2019: 3.6.4.1]

Glass in doors must be Grade A safety glazing material in accordance with Table 8.3.2Table 8.4.2 and Figure 8.3.2Figure 8.4.2, except that—

(a) unframed doors, other than those incorporated in shower screens or bath enclosures, must be glazed with toughened safety glass with a minimum nominal thickness of 10 mm or laminated toughened safety glass with a minimum total thickness of 10 mm; and

(b) individual pieces of ordinary monolithic annealed glass incorporated in leadlights may be used, to a maximum area of 0.05 m$^2$ with a minimum nominal thickness of 3 mm; and

(c) for annealed and annealed decorated glass panels in doors—

(i) for 3 mm and 4 mm annealed glass, the maximum area must not be more than 0.1 m$^2$ with a maximum panel width of 125 mm; and

(ii) for 5 mm and 6 mm annealed glass, the maximum area must not be more than 0.26 m$^2$ with a maximum panel width of 300 mm; and

(d) for annealed glass in fully framed panels with a thickness of 10 mm or more, with or without bevelled edges, the maximum area must not be more than 0.5 m$^2$; and

(e) doors in bathrooms, ensuites and spa rooms must be glazed in accordance with 8.3.68.4.6.

**Figure Notes:**
1. Door and side panel glazing areas – see Table 8.3.2.
2. Monolithic annealed glass – see Table 8.4.3.

**Explanatory Information:**
Larger areas of ordinary monolithic annealed glass in leadlights are not permitted regardless of glass thickness.

### 8.3.34.3 Door side panels

[2019: 3.6.4.2]

1. All framed glass (except leadlight panels) in side panels with their nearest vertical sight line less than 300 mm from the nearest edge of the doorway opening must be Grade A safety glazing material in accordance with Table 8.3.2 Table 8.4.2 and Figure 8.3.2 Figure 8.4.2, except that—
   (a) where the lowest visible sight line is less than 1.2 m or more above the highest abutting finished floor level, ordinary monolithic annealed glass with a minimum thickness of 5 mm and an area of 0.3 m² in accordance with Table 8.3.3 Table 8.4.3 may be used; or
(b) where the lowest visible sight line is less than 1.2 m above the highest abutting finished floor level, **ordinary monolithic** annealed glass with a minimum thickness of 10 mm in accordance with *Table 8.3.3 Table 8.4.3*, with an area of not more than 0.5 m², may be used; or

c) where the side panel consists of glass louvres with exposed edges or where the louvres are installed less than 500 mm above the highest abutting finished floor level—

   (i) for blade widths not more than 230 mm with blade lengths not more than 1 m, Grade A toughened safety glazing not less than 5 mm thick must be used; and

   (ii) for blade widths more than 230 mm, Grade A toughened safety glazing not less than 10 mm thick must be used.

(2) Framed glass panels with the nearest vertical sight line not less than 300 mm from the nearest edge of the door opening are not considered to be side panels for the purposes of (1).

### 8.3.4.4 Full height framed glazed panels

[2019: 3.6.4.3]

(1) A glazed panel located in a building so that it is capable of being mistaken for an *unobstructed opening* must be glazed with—Grade A safety glazing material in accordance with *Table 8.3.2 Table 8.4.2*; or

   (a) **ordinary monolithic** annealed glass complying with *Table 8.3.2 Table 8.4.2* provided the glazed area is not more than 0.9 m².

(2) Glazed panels are not considered an *unobstructed opening* where any of the following apply:

   (a) The clear opening width is not more than 500 mm.

   (b) The lowest sight line of the opening is not less than 500 mm above the highest abutting finished floor level.

   (c) The glass is made apparent by means of transoms, colonial bars, other components of the glazing system, permanent motifs or other decorative treatment on or etched into the glass, of sufficient magnitude to be readily apparent, or the glass is opaquely coloured or patterned to indicate its presence.

   (d) A chair rail or handrail not less than 40 mm thick, or the like, is provided at a height of no less than 865 mm above the adjoining ground level.

   (e) The difference in floor level on either side of the panel is greater than 500 mm.

### 8.3.5.4 Glazed panels, other than doors or side panels, on the perimeter of rooms

[2019: 3.6.4.4]

All framed glazing where the lowest sight line of the glazing panel is less than 500 mm from the highest abutting finished floor level (see *Figure 8.3.5 Figure 8.4.5*) must be—

   (a) Grade A safety glazing material in accordance with *Table 8.3.2 Table 8.4.2*; or

   (b) **ordinary monolithic** annealed glass not less than 5 mm nominal thickness provided that the area of the glazing panel is not more than 1.2 m².
### 8.3.6.4.6 Bathroom, ensuite, and spa room and splash-back glazing

[2019: 3.6.4.5]

1. All glazing in bathrooms, ensuites, spa rooms or the like, including shower doors, shower screens, bath enclosures, and associated windows, and doors, where the lowest sight line is less than 2.0 m above the highest abutting finished level of the floor, bottom of the bath, or shower base, must—
   - for framed panels, be glazed with Grade A safety glazing material in accordance with Table 8.4.2; or
   - Grade A safety glazing material in accordance with Table 8.3.2; or
   - Grade B safety glazing material in accordance with Table 8.3.6 (see also Figure 8.3.6); or
   - for panels or doors with any edge exposed, be toughened safety glass in accordance with Table 8.4.2 with a minimum nominal thickness of 6 mm.

2. Windows referred to in (1), may incorporate annealed glass panels of not less than 4 mm thickness, provided that they are not more than 0.1 m² in area.

3. Ordinary Monolithic annealed glass may be used for— including mirror, may be used provided a fixed vanity or bench with a height of not less than 760 mm, depth of not less than 300 mm and extending the full width of the glass or mirror is located in front of the glass or mirror.
   - mirrors, provided a fixed vanity or bench with a height of not less than 760 mm, depth of not less than 300 mm and extending the full width of the glass or mirror is, located in front of the glass or mirror; or
   - splash-backs, provided it is fully backed by and continuously adhered to a solid wall material or a fixed cabinet or bench that is—
     - a height not less than 760 mm; and
     - a depth not less than 300 mm; and
     - extending the full width of the splash-back; and
     - located in front of the splash back.

</tr>
</tbody>
</table>

Explanatory Information:
Care should be taken when using showers fitted with safety wired glass, safety organic-coated glass, and laminated safety glass products that are liable to damage from thermal shock. Thermal shock occurs from hot water from the shower hitting the shower screen during cold weather.

8.3.74.7 Visibility of glazing

[2019: 3.6.4.6]

(1) If the presence of glazing in a door, side panel or panel capable of being mistaken for a doorway or opening is not made apparent in accordance with 8.3.4(2)(c), the glass must be marked to make it readily visible in accordance with (2).

(2) Marking must be in the form of an opaque band not less than 20 mm in height located so that—
   (a) the upper edge is not less than 700 mm above the floor; and
   (b) the lower edge is not more than 1.2 m above the floor.

(3) A band or marking is not required where any of the following applies:
   (a) The height of the glazing is not more than 1 m in any part.
   (b) The width of the glazing panel is not more than 500 mm in any part.
(c) There is no glazing within 700 mm of the floor.

(d) The glazing is provided with not less than one fixed glazing bar which must—
   (i) be firmly attached to the styles to locate and protect each face of the glass; and
   (ii) be located with its upper edge not less than 500 mm and its bottom edge not more than 1 m above the floor; and
   (iii) have a face width not less than 40 mm.

Explanatory Information:
1. Making the glass visible by marking is not a substitute for the use of safety glazing in accordance with this Part.
2. A broken line or patterns may be an acceptable form of marking provided it meets the criteria set out in 8.3.7(2)s and 9.4.7(2).

8.4.8 Identification of safety glass

All safety glazing material in Tables 8.4.2 and 8.4.6 installed in accordance with this Part must comply with the following:

(a) Safety glass must be marked in the form of either permanent etching or a label that cannot be reused once removed.
(b) The permanent etching or label must state the following information:
   (i) The Standard to which the safety glass has been tested.
   (ii) Registered name of the manufacturer or supplier.
   (iii) Grade of the safety glass.
   (iv) Nominal thickness of the safety glass.

Explanatory Information:
The labelling of safety glass is not intended to remain after completion of construction. Labelling complying with 8.4.8 should remain in place on safety glass to allow relevant practitioners to confirm and certify that the correct type of safety glass has been installed in a specific area of the building.
If a label is able to be removed from the glass, it must be comprised of a material that self-destructs upon removal so as to prevent it being reused on other glass panels.
9 Fire safety

Part 9.1 Scope and application of Section 9
  9.1.1 Scope
  9.1.2 Application

Part 9.2 Fire separation of external walls
  9.2.1 External walls of Class 1 buildings
  9.2.2 Measurement of distances
  9.2.3 Construction of external walls
  9.2.4 Class 10a buildings
  9.2.5 Protection of Class 1 buildings — Class 10a between Class 1 and the allotment boundary
  9.2.6 Protection of Class 1 buildings—Class 10a between Class 1 and other buildings on allotment
  9.2.7 Protection of Class 1 buildings—separation of Class 10a buildings on an allotment
  9.2.8 Open carports
  9.2.9 Allowable encroachments
  9.2.10 Roof lights

  9.5.4 Installation of smoke alarms
  9.5.5 Lighting to assist evacuation – Class 1b buildings
Part 9.1  Scope and application of Section 9

9.1.1  Scope

[New for 2022]

(1) This Section of the ABCB Housing Provisions sets out the *Deemed-to-Satisfy Provisions* for—

(a) fire separation of *external walls* (see Part 9.2); and

(b) fire protection of separating walls (see Part 9.3); and

(c) fire separation of garage top dwellings (see Part 9.4); and

(d) smoke alarms and evacuation lighting (see Part 9.5).

(2) For other fire safety provisions not included in this Section of the ABCB Housing Provisions, refer to the following *Deemed-to-Satisfy Provisions* in NCC Volume Two: fire hazard properties (see H3D2(1) and (2)).

9.1.2  Application

[New for 2022]

The application of Section 9 of the ABCB Housing Provisions is subject to the following:

(a) The Governing Requirements of NCC 2022 Volume Two.

(b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:

In NCC 2019, the content of Section 9 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practice for Parts 3.7.2 to 3.7.5 of NCC 2019 Volume Two.

The content of Part 3.7.1 has been retained within Part H3 NCC Volume Two as it contains requirements which affect how other provisions referenced in Part H3 are applied.
Part 9.2  Fire separation of external walls

SA 9.2.1

9.2.1  External walls of Class 1 buildings

[2019: 3.7.2.2]

An external wall of a Class 1 building, and any openings in that wall, must comply with 9.2.3 if the wall is less than—

(a) 900 mm from an allotment boundary other than the boundary adjoining a road alignment or other public space; or

(b) 1.8 m from another building on the same allotment other than a Class 10 building associated with the Class 1 building or a detached part of the same Class 1 building.

9.2.2  Measurement of distances

[2019: 3.7.2.3]

(1) The distance from any point on an external wall of a building to an allotment boundary or another building is the distance to that point measured along a line at right angles from the allotment boundary or external wall of the other building which intersects that point without being obstructed by a wall complying with 9.2.3.

(2) Where a wall within a specified distance is required to comply with 9.2.3, only that part of the wall (including any openings) within the specified distance need be constructed in that manner (see Figure 9.2.2a, Figure 9.2.2b and Figure 9.2.2c).

(3) Where the distance measured is between attached or detached buildings of different heights, the distance must be taken from the external wall with the highest elevation measured at right angles to a point that intersects the nearest part of a vertical projection above the adjacent building, excluding any eave overhang (see Figure 9.2.2d and Figure 9.2.2e).

SA 9.2.2(4)
Figure 9.2.2a: Walls at right angles to the boundary

No protection *required* for this wall or any opening in this wall

**Figure Notes:**
1. No protection *required* for the wall at right angles or more to the boundary.
2. For protection of encroachments refer to 9.2.9.

---

Figure 9.2.2b: Measurement of distances — Full wall protection (Plan view)

Wall within 900 mm of boundary must have an FRL of 60/60/60

Only the wall facing or parallel to the boundary must have an FRL

**Figure Notes:**
Setback distance is measured at right angles to the boundary.
Figure 9.2.2c: Measurement of distances — Part walls protection (Plan view)

Wall within 900 mm of boundary must have an FRL of 60/60/60

Figure Notes:
Setback distance is measured at right angles to the boundary.

Figure 9.2.2d: Measurement of distance — Buildings of different heights — Class 1 buildings on same allotment

External wall within 1.8 m from another building
9.2.3 Construction of external walls

[2019: 3.7.2.4]

(1) **External walls** (including gables) **required** to be (referred to in 9.2.1 or 9.2.4) must—

(a) commence at the footings or ground slab, except where the **external wall** commences above a **separating wall** complying with 9.3.1 (see Figure 9.2.2d); and

(b) extend to—

(i) the underside of a **non-combustible** roof covering, except that a wall may terminate not more than 200 mm from the underside of a **non-combustible** roof covering, where the area between the **external wall** and underside of the roof covering is sealed with a **non-combustible** fascia, gutter or flashing; or

(ii) the underside of a **non-combustible** eaves lining (See Figures 9.2.3a and b); and

(c) be constructed in accordance with (2).

(2) A wall **required** by (1) must—

(a) have an FRL of not less than 60/60/60 when tested from the outside; or

(b) be of masonry-veneer construction in which the external masonry veneer is not less than 90 mm thick; or

(c) be of masonry construction not less than 90 mm thick.

(3) Openings in **external walls required** to be (referred to in 9.2.1 or 9.2.4) must be protected by—

(a) non-openable fire **windows** or other construction with an FRL of not less than –/60/–; or

(b) solid core doors not less than 35 mm thick.

(4) The requirements of (3) do not apply to a window in a **non-habitable room** that is located adjacent to and not less than 600 mm from the boundary of an adjoining allotment or 1200 mm from another building on the same allotment provided that—

(a) in a bathroom, laundry or toilet, the opening has an area of not more than 1.2 m²; or

(b) in a room other than one referred to in (a), the opening has an area of not more than 0.54 m² and—

(i) the **window** is steel-framed, there are no opening sashes and it is glazed in wired glass; or

(ii) the opening is enclosed with translucent hollow glass blocks.

(5) Subfloor vents, roof vents, weepholes, control joints, construction joints and penetrations for pipes, conduits and the like need not comply with (3).
Figure 9.2.3a: Typical construction of external walls

**Figure Notes:**

1. The *external wall* is deemed to extend to the underside of *non-combustible* roof covering, or *non-combustible* eaves lining, when constructed as shown.

2. Where sarking is installed it must be located so that ponding of water is avoided between the fascia and the first roofing batten.

3. The location of flashing and framing is indicative only.

4. Brickwork shown in diagram (b) is to be terminated in accordance with 9.2.3(1)(b).
**Figure 9.2.3b:** Typical construction of external walls — attached Class 1 buildings on the same allotment

![Diagram](image)

**(e) Attached Class 1 buildings on the same allotment**

**Figure Notes:**
1. The *external wall* is deemed to extend to the underside of *non-combustible* roof covering, or *non-combustible* eaves lining, when constructed as shown.
2. Where sarking is installed it must be located so that ponding of water is avoided between the fascia and the first roofing batten.
3. The location of flashing and framing is indicative only.
4. Brickwork shown in diagram (b) is to be terminated in accordance with 9.2.3(1)(b).

**Explanatory Information:**
1. A *Performance Solution* must be used where an *external wall required* to be *fire-resisting* does not commence in accordance with 9.2.3(1)(a).
2. The intent of the typical construction details shown in Figures 9.2.3a and b is to ensure that combustible materials (external or internal) are not directly exposed to fire at the junction of the wall and *non-combustible* roof, eaves lining, guttering and the like. Other forms of construction may also be acceptable provided that they achieve this intent.
3. See Figure 9.2.2a and clause 10.7.3 for internal *separating wall* construction under one common roof.

9.2.4 **Class 10a buildings**

[2019: 3.7.2.5]

1. A Class 1 building must be protected by a method in—
9.2.5 where a Class 10a building is located between or adjacent to a Class 1 building and a boundary alignment that is not a boundary with a road alignment or other public space; or

(b) 9.2.6 where a Class 10a building is located between or adjacent to a Class 1 building it is associated with and another building on the same allotment; or

(c) 9.2.7 where two or more Class 10a buildings on the same allotment are located between and are associated with different Class 1 buildings.

(2) A Class 10a building must not significantly increase the risk of spread of fire between Class 2 to 9 buildings.

Explanatory Information:

9.2.4(1)(a) ensures that when a Class 10 building is located between an allotment boundary and a Class 1 building or another building on the same allotment, either directly or indirectly, that the Class 1 building be protected by a wall with an FRL.

The intention is to prevent the spread of fire from an allotment boundary (fire source feature) to a Class 1 building via a Class 10a building. Where a Class 10a building is not sited directly and wholly between the allotment boundary and the Class 1 building (see 9.2.5), the potential of fire spreading from the allotment boundary to the Class 1 still exists. Therefore, fire separation would be *required*.

9.2.4 does not apply to a boundary that adjoins a road or public space such as parklands, lakes, rivers and the like where the construction of buildings is unlikely.

### 9.2.5 Protection of Class 1 buildings — Class 10a between Class 1 and the allotment boundary

The following methods are acceptable for the protection of a Class 1 building where a Class 10a building is located between or adjacent to a Class 1 building and a boundary alignment that is not a boundary with a road alignment or other public space:

(a) The Class 10a building is not less than 900 mm from the allotment boundary, other than the boundary adjoining a road alignment or other public space, as shown in *Figure 9.2.5a*.

(b) An *external wall* of the Class 10a building which is less than 900 mm from an allotment boundary, other than the boundary adjoining a road alignment or other public space, complies with 9.2.3 as shown in *Figure 9.2.5b*.

(c) An *external wall* of the Class 10a building, which is less than 900 mm from the Class 1 building, complies with 9.2.3 as shown in *Figure 9.2.5c*.

(d) The Class 1 building is not less than 900 mm from the Class 10a building, as shown in *Figure 9.2.5d*.

(e) An *external wall* of the Class 1 building, which is less than 900 mm from the Class 10a building, complies with 9.2.3, as shown in *Figure 9.2.5e*.

(f) An *external wall* of the Class 10a building which is less than 900 mm from an allotment boundary other than the boundary adjoining a road alignment or other public space, complies with 9.2.3, as shown in *Figure 9.2.5f*.

(g) An *external wall* of the Class 10a building, which is less than 900 mm from the *external wall* of the Class 1 building, complies with 9.2.3, as shown in *Figure 9.2.5g*.

(h) An *external wall* of the Class 1 building, which is less than 900 mm from a Class 10a building that is situated less than 900 mm from an allotment boundary, complies with 9.2.3, as shown in *Figure 9.2.5h*.

(i) The *external wall* of the Class 1 and Class 10a building which are less than 900 mm from an allotment boundary, other than the boundary adjoining a road alignment or other public space, complies with 9.2.3 as shown in *Figure 9.2.5i*. 

---

**Public Comment Draft**

**Fire safety**

(a) 9.2.5 where a Class 10a building is located between or adjacent to a Class 1 building and a boundary alignment that is not a boundary with a road alignment or other public space; or

(b) 9.2.6 where a Class 10a building is located between or adjacent to a Class 1 building it is associated with and another building on the same allotment; or

(c) 9.2.7 where two or more Class 10a buildings on the same allotment are located between and are associated with different Class 1 buildings.

(2) A Class 10a building must not significantly increase the risk of spread of fire between Class 2 to 9 buildings.

SA 9.2.4(3)

SA 9.2.4(4)

Explanatory Information:

9.2.4(1)(a) ensures that when a Class 10 building is located between an allotment boundary and a Class 1 building or another building on the same allotment, either directly or indirectly, that the Class 1 building be protected by a wall with an FRL.

The intention is to prevent the spread of fire from an allotment boundary (fire source feature) to a Class 1 building via a Class 10a building. Where a Class 10a building is not sited directly and wholly between the allotment boundary and the Class 1 building (see 9.2.5), the potential of fire spreading from the allotment boundary to the Class 1 still exists. Therefore, fire separation would be *required*.

9.2.4 does not apply to a boundary that adjoins a road or public space such as parklands, lakes, rivers and the like where the construction of buildings is unlikely.

9.2.6 Protection of Class 1 buildings—Class 10a between Class 1 and other buildings on allotment

[2019: Figure 3.7.2.5]

The following methods are acceptable for the protection of a Class 1 building where a Class 10a building is located between or adjacent to a Class 1 building it is associated with and another building on the same allotment:

(a) The Class 10a building is not less than 1.8 m from the other building, as shown in Figure 9.2.6a.

(b) An external wall of the Class 10a building, which is less than 1.8 m from the other building, complies with 9.2.3, as shown in Figure 9.2.6b.

(c) An external wall of the Class 10a building, which is less than 1.8 m from the Class 1 building, complies with 9.2.3, as shown in Figure 9.2.6c.

(d) The Class 1 building is not less than 1.8 m from the Class 10a building, as shown in Figure 9.2.6d.

(e) An external wall of the Class 1 building, which is less than 1.8 m from the Class 10a building, complies with 9.2.3, as shown in Figure 9.2.6e.

(f) An external wall of the Class 10a building, which is less than 1.8 m from the external wall of the other building, complies with 9.2.3, as shown in Figure 9.2.6f.

(g) An external wall of the Class 10a building, which is less than 1.8 m from the external wall of the Class 1 building, complies with 9.2.3, as shown in Figure 9.2.6g.
(h) An external wall of the Class 1 and 10a building, which is less than 1.8 m from the external wall of the other building, complies with 9.2.3, as shown in Figure 9.2.6h.

9.2.7 Protection of Class 1 buildings—separation of Class 10a buildings on an allotment

The following methods are acceptable for the protection of a Class 1 building where two or more Class 10a buildings on the same allotment are located between and are associated with different Class 1 buildings:
(a) Each Class 10a building must be separated from each other by a distance of not less than 1.8 m, as shown in Figure 9.2.7a.

(b) Each Class 10a building must be separated from each other by external walls complying with 9.2.3, as shown in Figure 9.2.7b.

(c) Each Class 10a building must be separated from each Class 1 building by a distance of not less than 900 mm, as shown in Figure 9.2.7c.

(d) Each Class 10a building must be separated from each Class 1 building by external walls complying with 9.2.3, as shown in Figure 9.2.7d.

(e) Each Class 10a building must be separated by a wall complying with 9.3.1, as shown in Figure 9.2.7e.

(f) Each Class 10a building must be separated from each other by external walls complying with 9.2.3, as shown Figure 9.2.7f.

(g) Each Class 10a building must be separated from each Class 1 building by external walls complying with 9.2.3, as shown in Figure 9.2.7g.

(h) Each Class 10a building must be separated by a wall complying with 9.3.1.

**Figure 9.2.7a:** 1.8m separation between Class 10a buildings

Less than 1.8 m

Wall with a FRL of 60/60/60
**9.2.8 Open carports**

A Class 10a carport is exempt from complying with 9.2.4(1) if—

(a) it has two or more sides open and not less than one third of its perimeter open; and

(b) for the purposes of (a), a side is considered to be open if the roof covering adjacent to that side is not less than 500 mm from another building or allotment boundary; and

(c) it has a polycarbonate or non-combustible roof covering; and

(d) any ceiling lining and wall cladding, including gables, is non-combustible (see Figure 9.2.8a); and

(e) it does not provide direct vertical support to any part of the Class 1 building; and

(f) in the case where it has a common roof structure with the Class 1 building and the carport does not have a ceiling (See Figure 9.2.8b), the opening between the top of the wall of the Class 1 building and the underside of the roof covering is infilled with—

(i) a non-combustible material; or

(ii) construction clad with non-combustible material on the carport side.
Identifying an open carport

Roof covering must be polycarbonate or non-combustible and any ceiling lining must be non-combustible.

Timber posts and beams are permitted adjacent to a boundary. However, wall cladding must be non-combustible.

Side of carport is considered open if no roof covering is over shaded area i.e. at least 500 mm from adjoining building or allotment.

(a) Example A

Side of carport less than 500 mm from allotment boundary, therefore side is considered closed.

Carport calculation

\[
\text{Open side} = \frac{3+3}{3+6+6+3} = \frac{6}{18} = \frac{1}{3}
\]

This carport satisfies the exemption criteria.

(b) Example B
Figure 9.2.8b: Requirements for non-combustible infill panels to carport

Explanatory Information:
A side of a carport enclosed by a vehicle access door is not considered to be an open side.

SA 9.2.9

9.2.9 Allowable encroachments

[2019: 3.7.2.7]

(1) An encroachment is any construction between

(a) between the external wall of the building and the allotment boundary other than a boundary adjoining a road or other public space; or

(b) between the external walls of two buildings on the same allotment; or

(c) between the external wall of the building and the vertical projection of the external wall of another adjoining building on the same allotment; or

(d) that extends beyond the vertical projection of another building on the same allotment other than a building it is associated with.

(2) For the purposes of (1), an encroachment relates to any external wall of—

(a) a Class 10a building required to comply with 9.2.4; or

(b) a Class 1 building.

(3) Encroachments allowed within 900 mm of an allotment boundary or within 1.8 m of another building, or its vertical
projection on the same allotment are—

(a) non-combustible fascias, gutters and downpipes; and
(b) light fittings, electricity or gas meters, aerials or antennas; and
(c) pergolas, sun blinds or water tanks (see Figure 9.2.9a); and
(d) unroofed terraces, landings, steps and ramps, not more than 1 m in height.

(4) Encroachments allowed up to but not closer than 450 mm from an allotment boundary or up to but not closer than 900 mm from another building, or its vertical projection, on the same allotment or associated encroachments of another building on the same allotment are—

(a) combustible fascias, gutters and downpipes (see Figure 9.2.9a, Figure 9.2.9b and Figure 9.2.9c); and
(b) eaves with non-combustible roof cladding and non-combustible lining; and
(c) flues, chimneys, pipes, domestic fuel tanks, cooling or heating appliances or other services.

(5) Encroachments allowed to project beyond between an external wall of a building and the vertical projection of another building, an adjoining building on the same allotment are non-combustible fascias, gutters and downpipes (see Figure 9.2.3e).

Figure 9.2.9a: Allowable encroachments for non-combustible construction — Combustible fascia up to but not closer than 450 mm to an allotment boundary

![Diagram of acceptable encroachments](image-url)
Figure 9.2.9b: Allowable encroachments for non-combustible construction — Non-combustible fascia and gutter within 900 mm of an allotment boundary

Diagramatic framing only

Figure 9.2.9c: Allowable encroachments for non-combustible construction — Unroofed pergola within 900 mm of an allotment boundary

Explanatory Information:
A deck is not considered an unroofed terrace and is therefore not permitted as an allowable encroachment under 9.2.9 whether combustible or not.

The term ‘pergola’ is a reference to an unroofed structure.
9.2.10 Roof lights

Combustible roof lights, skylights or the like installed in a roof or part of a roof required to have a non-combustible covering must—

(a) have an aggregate area not more than 20% of the roof or part of the roof; and
(b) not less than—
   (i) 900 mm from the allotment boundary other than the boundary adjoining a road alignment or other public space; and
   (ii) 1.8 m from any roof light or the like in another building on the allotment other than an associated building or a detached part of the same building. (See Figure 9.2.10).

Figure 9.2.10: Location of combustible roof lights

Figure Notes:
Roof lights depicted in Figure 9.2.10 are combustible.
9.3.1 Separating walls

(1) A separating wall between Class 1 buildings, or a wall that separates a Class 1 building from a Class 10a building which is not associated with the Class 1 building must—
   (a) be constructed—
      (i) having an FRL of not less than 60/60/60; or
      (ii) of masonry not less than 90 mm thick; and
   (b) commence at the footings or ground slab (see Figure 9.3.1a), except for horizontal projections to which 9.3.4 applies (see Figure 9.3.4); and
   (c) extend—
      (i) if the building has a non-combustible roof covering, to the underside of the roof covering (see Figure 9.3.1a and Figure 9.3.1b); or
      (ii) if the building has a combustible roof covering, to not less than 450 mm above the roof covering (see Figure 9.3.1a); and
   (d) comply with (2) to (5) and 9.3.2 as applicable.

(2) A separating wall of lightweight construction must be tested in accordance with Specification 6.

(3) A separating wall complying with (1)(c)(i)—
   (a) must not be crossed by timber or other combustible building elements except for roof battens with dimensions of 75 x 50 mm or less, or roof sarking; and
   (b) must have any gap between the top of the wall and the underside of the roof covering packed with mineral fibre or other suitable material.

(4) Where a building has a masonry veneer external wall, any gap between the separating wall and the external masonry veneer must be—
   (a) not more than 50 mm; and
   (b) packed with a mineral fibre or other suitable fire resistant material with the packing arranged to maintain any weatherproofing requirements of H2D4.

(5) Eaves, verandahs and similar spaces that are open to the roof space and are common to more than one Class 1 dwelling must be separated by a non-combustible vertical lining (see Figure 9.3.1c).
Figure 9.3.1a: Separating wall construction

- Separating wall to extend 450 mm above combustible roof covering
- Combustible roof covering
- Non-combustible roof coverings

9.3.1 Public Comment Draft

Fire safety

9.3.2 Services in separating walls

(1) Any service opening, other than those listed in (2), (3) and (4), in a separating wall must have construction with an FRL of not less than -/60/60.

(2) If an electrical wire or cable penetrates a separating wall—
   (a) the service and building element at the penetration must—
      (i) be identical with a prototype assembly that has been tested in accordance with AS 4072.1 and AS 1530.4 and achieve an FRL of not less than -/60/60; or
      (ii) differ from a prototype assembly of the service and building element in accordance with AS 4072.1; or
   (b) the service must be installed so that—
      (i) the opening is neatly formed, cut or drilled and no closer than 50 mm to any other service; and
      (ii) the opening is no larger in cross-section than—
         (A) 2000 mm\(^2\) if only a single cable is accommodated and the gap between the cable and the wall is no wider than 15 mm; or
         (B) 500 mm\(^2\) in any other case; and
      (iii) any gap between the service and the wall is packed with mineral fibre or other suitable fire resistant material.

(3) If an electrical switch, outlet, socket or the like is accommodated in a separating wall—
   (a) the service and building element at the penetration must—
      (i) be identical with a prototype assembly which has been tested in accordance with AS 4072.1 and AS 1530.4 and achieve an FRL of not less than -/60/60; or
      (ii) differ from a prototype assembly of the service and building element in accordance with AS 4072.1; or

Figure 9.3.1c: Separating wall construction — Underside of non-combustible roof cladding (diagram 2)

OPTION 1 Non-combustible vertical lining installed between roof space of one Class 1 and the common eaves or verandah space

OPTION 2 Non-combustible vertical lining installed in common eaves or verandah space

Note: The non-combustible vertical lining need only be installed on one side of a rafter, truss or supporting framework, provided that it forms a continuous barrier with the separating wall.

Figure Notes:
Elements crossing the non-combustible vertical lining must comply with 9.3.1(3).
(b) the service must be installed so that—
   (i) the opening or recess—
   (A) is not located opposite any point within 300 mm horizontally or 600 mm vertically of any opening or recess on the opposite side of the wall; or
   (B) does not extend beyond half the thickness of the wall; and
   (ii) any gap between the service and the wall is packed with mineral fibre or other suitable fire resistant material.

(4) Other than where a tested system is used in accordance with (3)(a), if an electrical switch, socket, outlet or the like is accommodated in a hollow separating wall, the cavity immediately behind the service must be framed and packed with mineral fibre or other suitable fire resistant material (see Figure 9.3.2).

**Figure 9.3.2: Separating wall construction — Services in cavity construction**

**Explanatory Information:**
For the purposes of 9.3.2 and 10.7.2, a reference to a separating wall includes a wall that separates a Class 1 building from a Class 10a building that is not associated with the Class 1 building.

It is important that any opening in a separating wall between Class 1 buildings does not allow the free passage of fire between buildings. Many designs would require the installation of openings for electrical cables and outlets in these walls. 9.3.2 therefore allows such openings provided they comply with the requirements of that provision.

A reference to a hollow separating wall in 9.3.2(4) may include a stud wall, masonry cavity wall or a wall of hollow blockwork.

**Part 10.7** (sound insulation) also contains requirements relevant to separating walls, in addition to the provisions of this Part. This includes installation requirements for walls and services to achieve appropriate levels of sound insulation.
9.3.3 Roof lights

[2019: 3.7.3.4]

Combustible roof lights, skylights or the like installed in a roof or part of a roof required to have a non-combustible covering must—

(a) have an aggregate area not more than 20% of the roof or part of the roof; and
(b) be not less than 900 mm from the vertical projection of a separating wall extending to the underside of the roof covering.

9.3.4 Horizontal projections

[2019: 3.7.3.5]

(1) Where a horizontal projection forms part of a separating wall complying with 9.3.1, any horizontal projection within 1.8 m on each side of the separating wall (see Figure 9.3.4) must—

(a) be a floor/ceiling or floor/soffit system incorporating a ceiling or soffit which has a resistance to the incipient spread of fire to the space above itself of not less than 60 minutes; or
(b) have an FRL not less than 30/30/30 when tested from the underside; or
(c) have a fire-protective covering on the underside of the floor, including beams incorporated in it, if the floor is combustible or of metal.

(2) The part of the separating wall that projects outwards horizontally must—

(a) extend to the underside of the floor/ceiling or floor/soffit system complying with (1); and
(b) not be crossed by timber or other combustible building elements except for framing members with dimensions of 75 x 50 mm or less, or sarking; and
(c) have any gap between the bottom of the wall and the underside of the floor/ceiling or floor/soffit system packed with mineral fibre or other suitable material.

(3) Where a floor subject to (1)(b) depends on direct vertical or lateral support from another part to maintain its FRL, that supporting part must have an FRL of not less than 30/-/-.

(4) Where a service passes through a floor referred to in (1), the penetration must not reduce the fire performance of the floor or covering.
Figure 9.3.4: Horizontal projection forming part of a separating wall

Class 1 buildings on same allotment

Horizontal projection forms part of a *separating wall*

Horizontal projection within 1.8 m of another building must be protected

*Separating wall* between Class 1 buildings

**Figure Notes:**
Horizontal projections within 1.8 m of another building must be protected in accordance with 9.3.4(1).
9.4.1 Walls requiring protection

(1) Where parts of a Class 1a dwelling are located above a Class 10a private garage that is not associated with the Class 1a dwelling—
   (a) any wall separating parts of the Class 1a dwelling from the private garage not associated with the dwelling must comply with (2); and
   (b) any private garage associated with and located below the Class 1a dwelling must be separated from the private garage not associated with the dwelling by a wall complying with (2).

(2) A wall required by (1) must—
   (a) have either—
      (i) an FRL of not less than 60/60/60 when tested from the private garage associated with another dwelling side; or
      (ii) be of masonry construction not less than 90 mm thick; and
   (b) commence at the footings or ground slab; and
   (c) extend to the underside of a separating floor complying with 9.4.2; and
   (d) comply with 9.3.1(2) to (5) and 9.3.2 as applicable.

9.4.2 Separating floors

(1) Where parts of a Class 1a dwelling are located above or below a Class 10a private garage that is not associated with the Class 1a dwelling, any floor separating the Class 1a dwelling from the Class 10a private garage not associated with the dwelling must—
   (a) be a floor/ceiling or floor/soffit system incorporating a ceiling or soffit which has a resistance to the incipient spread of fire to the space above itself of not less than 60 minutes; or
   (b) have an FRL not less than 30/30/30 when tested from the underside; or
   (c) have a fire-protective covering on the underside of the floor, including beams incorporated in it, if the floor is combustible or of metal.

(2) Where a floor subject to (1)(b) depends on direct vertical or lateral support from another part to maintain its FRL, that supporting part must have an FRL of not less than 30/-/-.

(3) Where a service passes through a floor referred to in (1), the penetration must not reduce the fire performance of the floor or covering.

(4) See Figure 9.4.2.
Figure 9.4.2: Separating wall and floor construction

Figure Notes:
1. For floor/ceiling protection, see 9.4.1(2)(c) and 9.4.2.
2. For FRL for direct supporting part, 9.4.2(2).
3. For FRL for wall separating parts of the Class 1a dwelling from the non-associated private garage, see 9.4.1(1).
NSW 9.5.1

9.5.1 Smoke alarm requirements

Smoke alarms must—

(a) be located in—
   (i) Class 1a buildings in accordance with 9.5.2 and 9.5.4; and
   (ii) Class 1b buildings in accordance with 9.5.3 and 9.5.4; and
(b) comply with AS 3786, except that in a Class 10a private garage where the use of the area is likely to result in smoke alarms causing spurious signals, any other alarm deemed suitable in accordance with AS 1670.1 may be installed provided that smoke alarms complying with AS 3786 are installed elsewhere in the Class 1 building; and
(c) be powered from the consumer mains source where a consumer mains source is supplied to the building; and
(d) be interconnected where there is more than one alarm.

Explanatory Information:

A smoke alarm can give spurious alarms if the atmosphere contains particles which obscure vision, such as could occur in a Class 10a private garage part of a building. 9.5.1(b) therefore allows the use of a more suitable alarm, such as a heat alarm, in these locations.

9.5.1(d) requires alarms to be interconnected where there is more than one alarm. This only applies within a single dwelling. Therefore, alarms in a Class 1a dwelling need not be interconnected with alarms in another dwelling or a private garage which does not belong to the Class 1a dwelling.

9.5.2 Location – Class 1a buildings

[2019: 3.7.5.3]

(1) In a Class 1a building, smoke alarms must be located in—
   (a) any storey containing bedrooms, every corridor or hallway associated with a bedroom, or if there is no corridor or hallway, in an area between the bedrooms and the remainder of the building; and
   (b) each other storey not containing bedrooms.

(2) See Figure 9.5.2a and Figure 9.5.2b.
Figure 9.5.2a: Class 1a building where all bedrooms are grouped together and served by a hallway

Figure Notes:
In this diagram, the location of the smoke alarm is indicated by a black dot.

Figure 9.5.2b: Class 1a building where bedrooms are located in separate areas

Smoke alarms *required* to be interconnected
9.5.3 Location – Class 1b buildings

(1) In a Class 1b building, smoke alarms must be located in—
   (a) every bedroom; and
   (b) every corridor or hallway associated with a bedroom, or if there is no corridor or hallway, in an area between the bedrooms and the remainder of the building; and
   (c) each other storey.

(2) See Figure 9.5.3.

9.5.4 Installation of smoke alarms

Smoke alarms required by 9.5.2 and 9.5.3 must be installed on or near the ceiling, in accordance with the following:

(a) Where a smoke alarm is located on the ceiling it must be—
   (i) a minimum of 300 mm away from the corner junction of the wall and ceiling; and
   (ii) between 500 mm and 1500 mm away from the high point and apexes of the ceiling, if the room has a sloping ceiling.

(b) Where (a) is not possible, the smoke alarm may be installed on the wall, and located a minimum of 300 mm and a maximum of 500 mm off the ceiling at the junction with the wall.
Fire safety

Explanatory Information:
Smoke alarms need to be located on (or near) the ceiling for optimum detection of smoke in a fire situation with special care taken to avoid dead air spaces. A dead air space is an area in which trapped hot air will prevent smoke from reaching the alarm. This space generally occurs at the apex of cathedral ceilings, the corner junction of walls and ceilings and between exposed joists etc. (see explanatory Figure 9.5.4).

Smoke alarms may be located on the wall in accordance with 9.5.4(b). Explanatory Figure 9.5.4 provides location criteria and the dimensional relationship to building elements and the associated dead air spaces.

Figure 9.5.4 (explanatory): Installation of smoke alarms to avoid dead air space

9.5.5 Lighting to assist evacuation – Class 1b buildings

[2019: 3.7.5.6]

In a Class 1b building, a system of lighting must be installed to assist evacuation of occupants in the event of a fire, and—

(a) be activated by the smoke alarm required by 9.5.3(1)(b); and

(b) consist of—
   (i) a light incorporated within the smoke alarm; or
   (ii) the lighting located in the corridor, hallway or area served by the smoke alarm.

Explanatory Information:
The lighting required by 9.5.5 may consist of artificial lighting which may already be installed in a corridor, hallway or area, provided that the lighting is activated by the smoke alarm. However consideration should be given to ensure that the lighting is not controlled by a dimmer or timer controlled switch which may dim the level of light to an ineffective level, or switch the light off before occupants have time to evacuate.

10.1.1 Scope

This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for—

(a) wet areas and external waterproofing (see Part 10.2); and
(b) room heights (see Part 10.3); and
(c) facilities (see Part 10.4); and
(d) light (see Part 10.5); and
(e) ventilation (see Part 10.6); and
(f) sound insulation (see Part 10.7); and
(g) condensation management (see Part 10.8).

10.1.2 Application

The application of Section 10 of the ABCB Housing Provisions is subject to the following:

(a) The Governing Requirements of NCC 2022 Volume Two.
(b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

**Explanatory Information:**

In NCC 2019, the content of Section 10 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.8.1 to 3.8.7 of NCC 2019 Volume Two.
**SA 10.2.1**

**10.2.1 Wet areas**

(1) Building elements in *wet areas* within a building must be protected with a waterproofing system—

   (a) waterproof or water resistant in accordance with 10.2.2 to 10.2.7; and

   (b) comply with AS 3740.

(2) The waterproofing system in (1) must be either waterproof or water resistant in accordance with 10.2.2 to 10.2.6.

**10.2.2 Shower area (enclosed and unenclosed)**

(1) For a *shower area* with a hob, step-down or without a hob or step-down, the following applies:

   (a) The floor of the *shower area* must be waterproof, including any hob or step-down (see Figure 10.2.2); and

   (b) The walls of the *shower area* must be waterproof (see Figure 10.2.2)—

      (i) waterproof for all walls in *shower area* to a height the greater of—

      (A) not less than 150 mm above floor substrate; or

      (B) not less than 25 mm above maximum retained water level; and

      (ii) water resistant for walls to not less than 1800 mm above finished floor level of the shower.

   (c) Wall junctions and joints within the *shower area* must be waterproof not less than 40 mm either side of the junction (see Figure 10.2.2).

   (d) Wall/floor junctions within the *shower area* must be waterproof (see Figure 10.2.2).

   (e) Penetrations within the *shower area* must be waterproof.

(2) A shower with a preformed shower base must also comply with the requirements of (1), except for (a) and (b)(i) which are not applicable.
Figure 10.2.2: **Extent of treatment for shower areas — concrete and compressed fibre-cement sheet floors**

![Diagram of shower area treatment](image)

**Figure Notes:**

- **Wall/floor junction heights** are to be as per 10.2.2 to 10.2.6 (as applicable).

**(b) Unenclosed shower - Concrete and compressed fibre cement sheet floors**
Notes:
Where a shower is above a bath or spa, use requirements for shower.

10.2.3 Area outside shower area

[2019: Table 3.8.1.1]

1. For concrete, and compressed fibre-cement and fibre-cement sheet flooring, the floor of the room must be water resistant.
2. For timber floors including particleboard, plywood and other timber based flooring materials, the floor of the room must be waterproof.
3. Wall/floor junctions must be waterproof.
   (a) waterproof; and
   (b) where a flashing is used, the horizontal leg must be not less than 40 mm.

10.2.4 Areas adjacent to baths and spas (other than inserted baths and spas)

[2019: Table 3.8.1.1]

1. Freestanding baths and spas — For concrete, and compressed fibre-cement and fibre-cement sheet flooring, the floor of the room must be water resistant.
2. Freestanding baths and spas — For timber floors including particleboard, plywood and other timber based flooring materials, the floor of the room must be waterproof.
3. Walls must be water resistant (see Figure 10.2.4a and Figure 10.2.4b) —
   (a) to a height of not less than 150 mm above the vessel, for the extent of the vessel, where the vessel is within 75 mm of a wall; and
   (b) for all exposed surfaces below vessel lip.
4. Wall junctions and joints must be water resistant junctions within 150 mm above a vessel for the extent of the vessel (see Figure 10.2.4a and 10.2.4b).
5. Wall/floor junctions must be water resistant for the extent of the vessel (see Figure 10.2.4a and Figure 10.2.4b).
6. Tap and spout penetrations must be waterproof where they occur in horizontal surfaces.
Figure 10.2.4a: Unenclosed showers above baths — area protected for concrete, compressed fibre-cement and fibre-cement sheet flooring

(a) Plan view

(b) Isometric view
Figure 10.2.4b: Unenclosed showers above baths—areas protected for timber floors including particle-board, plywood and other floor materials

(a) Plan view

Waterproof to 1800 mm from finished floor level, width of 40 mm either side of the junction

If confined by shower screen

Optional shower panel

Waterproof entire floor

(b) Isometric view

Waterproof to 1800 mm from finished floor level width of 40 mm either side of the junction

Shower panel sealed at all junctions

Seal tap, shower rose and bath spout penetrations

Waterproof junction width of 40 mm either side of the junction

Waterproof junction to 1500 mm from the shower connection at the wall 25 mm above finished floor level

Floor waste

Waterproof bath lip/tile joint

Waterproof entire floor
10.2.5 Areas adjacent to inserted baths and spas

(1) Floors and horizontal surfaces:
   (a) *Waterproof* shelf area, incorporating waterstop under bath lip.
   (b) No requirement under bath.

(2) Walls:
   (a) *Waterproof* to not less than 150 mm above lip of bath or spa.
   (b) No requirement under bath.

(3) Wall junctions and joints:
   (a) *Waterproof* junctions within 150 mm above bath or spa.
   (b) No requirement under bath.

(4) Tap and spout penetrations must be *waterproof* where they occur in horizontal surfaces.

10.2.6 Other areas

(1) For walls adjoining other types of *vessel* (e.g. sink, basin or laundry tub), the following applies:
   (a) Walls must be *water resistant* to a height of not less than 150 mm above the *vessel*, for the extent of the *vessel*, where the *vessel* is within 75 mm of a wall *(see Figure 10.2.6)*.
   (b) *Waterproof* wall junctions where a *vessel* is fixed to a wall.
   (c) *Waterproof* tap and spout penetrations where they occur in surfaces required to be *waterproof* or *water resistant*.

(2) For laundries and WCs, the following applies:
   (a) *The floor of the room must be water resistant*.
   (b) Wall/floor junctions must be *water resistant*, and where a *flashing* is used, the horizontal leg must not be less than 40 mm.

(3) For WCs with handheld bidet spray installations, the following applies:
   (a) *The floor of the room must be waterproof*.
   (b) Walls must be—
      (i) *waterproof* in WC area within a 1500 mm radius from the wall connection of the handheld bidet spray device to a height of not less than 150 mm above substrate; and
      (ii) *water resistant* in WC area within a 1500 mm radius from the wall connection of the handheld bidet device to not less than 1800 mm above the finished floor level of the WC.
   (c) Wall junctions within WC area within 150 mm radius from the wall connection of the handheld bidet spray device must be *waterproof*.
   (d) Wall/floor junctions within WC area within 150 mm radius from the wall connection of the handheld bidet spray device must be *waterproof*.
   (e) Penetrations in WC area must be *waterproof*. 
10.2.6 Bath and vessel abutting wall — areas to be protected

Figure 10.2.6: Bath and vessel abutting wall — areas to be protected

(a) Vessel abutting wall

(b) Wall/bath junction

10.2.7 External above ground membranes

Waterproofing membranes for external above ground use must comply with AS 4654.1 and AS 4654.2.

10.2.7 Waterproofing systems

(1) For 10.2 of the ABCB Housing Provisions, a waterproofing system is deemed—
   (a) waterproof, if it complies with (2); or
   (b) water resistant, if it complies with (3).

(2) For a waterproofing system required to be waterproof in accordance with 10.2.2 to 10.2.6, the materials nominated in 10.2.9 must be used in conjunction with the—
   (a) water resistant substrate materials in 10.2.10; and
   (b) water resistant surface materials in 10.2.11.

(3) For a waterproofing system required to be water resistant in accordance with 10.2.2 to 10.2.6, the materials nominated in 10.2.10 must be used in conjunction with the materials in 10.2.11.
10.2.8 Materials

Materials used in wet areas forming waterproofing system must be either waterproof or water resistant in accordance with 10.2.2 to 10.2.6.

10.2.9 Materials — waterproof

The following materials used in waterproofing systems are deemed to be waterproof—

(a) Stainless steel.
(b) Flexible waterproof sheet flooring material with sealed joints.
(c) Membranes complying with AS 3740.

10.2.10 Materials — water resistant substrates

The following materials are deemed to be water resistant:

(a) For walls:
   (i) Concrete complying with AS 3600, treated to resist moisture.
   (ii) Cement render, treated to resist moisture movement.
   (iii) Compressed fibre-cement sheeting manufactured in accordance with AS/NZS 2908.2.
   (iv) Water resistant plasterboard sheeting.
   (v) Masonry in accordance with AS 3700, treated to resist moisture movement.

(b) For floors:
   (i) Concrete complying with AS 3600.
   (ii) Concrete slabs complying with AS 2870.
   (iii) Compressed fibre-cement sheeting manufactured in accordance with AS/NZS 2908.2 and supported on a structural floor.

10.2.11 Materials — water resistant surface materials

The following surface materials are deemed to be water resistant:

(a) For walls:
   (i) Thermosetting laminate.
   (ii) Pre-decorated compressed fibre-cement sheeting manufactured in accordance with AS 2908.2.
   (iii) Tiles when used in conjunction with a substrate listed in 10.2.10.
   (iv) Water resistant flexible sheet wall material with sealed joints when used in conjunction with a substrate listed in 10.2.10.
   (v) Sanitary grade acrylic linings.

(b) For floors, when used in conjunction with a substrate listed in 10.2.10:
   (i) Tiles.
   (ii) Water resistant flexible sheet flooring material with welded joints.
10.2.12  Construction of wet areas — wall and floor substrate materials

For compliance with 10.2 of the ABCB Housing Provisions, floor wall and floor lining materials used in substrates must comply with 10.2.10.

10.2.13  Construction of wet areas — wall and floor surface materials

For compliance with 10.2 of the ABCB Housing Provisions, floor wall and floor lining materials used in surface must comply with 10.2.11.

10.2.14  Construction of wet area floors — falls

Where a floor waste is installed—
(a) the minimum continuous fall to the waste must be 1:80; and
(b) the maximum continuous fall to the waste must be 1:50.

10.2.15  Acceptable shower area

Shower areas must be designed—
(a) as either enclosed or unenclosed; and
(b) to include a floor waste with falls complying with 10.2.14; and
(c) with a—
   (i) stepdown complying with 10.2.16; or
   (ii) hob complying with 10.2.17; or
   (iii) level threshold complying with 10.2.18.

10.2.16  Stepdown showers

The highest finished floor level of the shower area must be stepped down a minimum of 25 mm lower than the finished floor level outside the shower (see Figures 10.2.16a and 10.2.16b).
Figure 10.2.16a: **Typical stepped down shower construction (diagrams (a) and (b))**

Height to be 25 mm above the maximum retained water level or 150 mm above the finished tile level of the floor in the shower area whichever is the highest.

(a) Enclosed shower-Membrane below tile bed

(b) Enclosed shower-Membrane above tile bed
Figure 10.2.16b: Typical stepped-down shower construction (diagrams (c) and (d))

(c) Unenclosed shower-Membrane below tile bed

(d) Unenclosed shower-Membrane above tile bed
10.2.17 Hob construction

(1) **Hobs must be constructed of—**
   (a) masonry; or
   (b) concrete; or
   (c) primed autoclaved aerated concrete; or
   (d) extruded polyurethane foam,
   in accordance with Figure 10.2.17.

(2) All gaps, joints and intersections of the hob substrate must be made flush before application of the membrane.

(3) Hobs must be adequately secured to the floor and sealed against the wall prior to applying an internal membrane.

(4) Timber must not be used for hob construction.

**Figure 10.2.17:** Typical hob construction — internal membrane

**Figure Notes:**
For shower screen positioning, see 10.2.31.

10.2.18 Enclosed showers with level threshold (without hob or set down)

At the extremity of the shower area, a waterstop must be positioned so that its vertical leg finishes where—

(a) a shower screen is to be installed, not less than 5 mm above the finished floor level (see Figure 10.2.18); and

(b) the waterstop intersects with a wall or is joined, the junction must be waterproof.
10.2.19 Unenclosed showers

(1) Unenclosed showers must be constructed as follows:

(a) Waterstop must be installed a minimum horizontal distance of 1500 mm from the shower rose; and

(b) The vertical leg of the waterstop must finish—

(i) flush with the top surface of the floor (see Figure 10.2.19); and

(ii) where the waterstop intersects with a wall or is joined—

(A) the junction must be waterproof; or

(B) the whole wet area floor must be waterproofed and drained to a floor waste as for the shower area.

(2) In the case of (1)(b)(iii), at doorways, where the height of the tiling angle needs to be adjusted for tiling purposes, the angle must be fixed with a sealant compatible with the waterproofing membrane without damaging the waterproofing system.

Figure Notes:

Fall is to be provided in accordance with 10.2.14.
10.2.20 Preformed shower bases

Shower bases must—

(a) have an upturn lip (see Figure 10.2.20a and Figure 10.2.20b); and

(b) be recessed into the wall to allow the water resistant surface materials to pass down inside the perimeter upturn lip of the shower base (see Figure 10.2.20a and Figure 10.2.20b); and

(c) be supported to prevent distortion or cracking.

Figure 10.2.20a: Typical preformed shower base wall/floor junction
Figure 10.2.20b: Typical preformed shower base/floor junction on timber floors, including particleboard, plywood and other timber materials

10.2.21 Baths and spas

Baths and spas must—

(a) have an upturn lip; and
(b) be recessed into the wall (see Figure 10.2.21); and
(c) have the water resistant surface materials of the wall pass down inside the upturn lip (see Figure 10.2.21); and
(d) be supported to prevent distortion and cracking.
**Figure 10.2.21: Typical bath junctions**

(a) Bath/wall junction - recessed

- Water-resistant surface material of the wall
- Waterproof sealant
- Wall rebate to accommodate rim of bath

(b) Bath/wall junction - battened

- Wall sheeting
- Water-resistant surface material of the wall
- Waterproof sealant
- Batten to accommodate rim of bath

(c) Bath/shelf junction

- Water stop
- Waterproof sealant
- Floor tile
- Water stop under bath lip to project a minimum of the 5 mm above the tile surface
- Membrane
- Shelf substrate
- Mortar tile bed
10.2.22 Membrane installation for screed

[New for 2022]

Where a screed is used in conjunction with a waterproof membrane, the waterproof membrane must be installed above the tile bed or screed.

10.2.23 Substrate surface preparation for application of membrane

[New for 2022]

The substrate surface area where a membrane is to be applied must—

(a) be clean and dust free; and
(b) free of indentations and imperfections.

10.2.24 Penetrations

[New for 2022]

Penetrations within shower areas must comply with the following:

(a) Penetrations for taps, shower nozzles and the like must be waterproofed by sealing with—
   (i) sealants; or
   (ii) proprietary flange systems.
(b) The spindle housing of the tap body must be able to be removed to enable replacement of the washer without damaging the seal.
(c) The following must be waterproofed:
   (i) All penetrations due to mechanical fixings or fastenings of substrate materials.
   (ii) Any penetration of the surface materials due to mechanical fixings or fastenings.
   (iii) Recessed soap holders (niches) and the like.
(d) Tap and spout penetrations on horizontal surfaces surrounding baths and spas must be waterproofed by—
   (i) sealing the tap body to the substrate with sealants; or
   (ii) proprietary flange systems.

10.2.25 Flashings/junctions

[New for 2022]

Flashings must be installed in accordance with 10.2.2 to 10.2.6 and the following:

(a) Perimeter flashing to wall/floor junctions must have a vertical leg of not less than 25 mm above the finished floor level, except across doorways, and the horizontal leg must have a width of not less than 50 mm.
(b) Where a water resistant substrate is used in conjunction with a water resistant surface material, a waterproof sealant must be installed after the finishes have been applied at the wall/floor junction.
(c) Perimeter flashings at floor level opening must comply with the following:
   (i) Where the whole wet area floor is waterproof, at floor level openings, a waterstop must be installed that has a vertical leg finishing flush with the top of the finished floor level with the floor membrane being terminated to create a waterproof seal to the waterstop and to the perimeter flashing (see Figure 10.2.25).
   (ii) In any other case, at floor level openings a waterstop must be installed that has a vertical leg finishing flush with the top of the finished floor level and waterproofed to the perimeter flashing.
(d) Vertical flashing, either external to the wet area or internal, must terminate not less than 1800 mm above the finished floor level.
Figure 10.2.25: Typical bathroom door details for whole bathroom waterproofing

Explanatory Information:

Vertical flashing may be used as follows:

(a) After installation of architrave

(b) Prior to installation of architrave
(a) **External vertical flashing** may be used with external *membrane* systems and installed behind the wall sheeting or render. They must have legs of sufficient width to allow the wall sheeting or render to overlap by not less than 32 mm.

(b) **Internal vertical flashing** may be used with both external and internal *membrane* systems provided each leg has a minimum overlap of 40 mm to the wall sheeting or render and where used with—

   (i) internal membranes, must extend vertically from the shower tray; and

   (ii) external membranes, must overlap the top edge of the floor *waterproofing system* by not less than 20 mm; and

   (iii) preformed shower bases or baths, must extend to the bottom edge of the wall sheeting or render.

### 10.2.26 Shower area floor membrane application

[New for 2022]

The *membrane* must be applied over the floor and up the vertical face of the wall substrate material as follows:

(a) For showers with *hobs* or stepdowns, to a height the greater of—

   (i) not less than a height of 150 mm above the finished tile level of the floor; or

   (ii) 25 mm above the maximum retained water level.

(b) For hobless showers, not less than a height of 150 mm above the finished tile level of the floor.

### 10.2.27 Membrane requirements for wall sheeting or render substrates

[New for 2022]

1. Where wall sheeting or render is used with an external *membrane* system in a shower area it must be waterproof to prevent moisture movement by capillary action.

2. Where *water resistant* plasterboard is used all cut edges that have the potential to be affected by moisture must be waterproofed, including the bottom edge over a preformed shower base.

### 10.2.28 Bond breaker installation for bonded membranes

[New for 2022]

1. *Bond breakers* must be installed at all wall/floor, *hob*/wall junctions and at movement joints where the membrane is bonded to the substrate.

2. *Bond breakers* must be of the type compatible with the flexibility class of the membrane to be used.

**Explanatory Information:**

*Typical details for bond breaker types are given in Figure 10.2.28.*
Figure 10.2.28 (explanatory): Typical bond breaker details

Figure Notes:
1. Bond breakers for Class I membranes (low extensibility) allow the membrane to flex rather than stretch.
2. Bond breakers for Class II membranes (medium extensibility) allow the membrane to stretch. If a tape is used as a bond breaker, either the membrane must not bond to the tape or the tape must have elastic properties similar to
3. *Bond breakers* for Class III membranes (high extensibility) allow the *membrane* to have an even thickness.

### 10.2.29 Installation of internal membranes

[New for 2022]

1. **Where a shower has a hob—**
   
   (a) *the membrane* must be brought over the top of the *hob*, down the outside face and terminate not less than 50 mm onto the floor (see Figure 10.2.17); and
   
   (b) *the membrane* must comply with Figure 10.2.29 for an internal shower tray.

2. **Where the shower has a waterstop, the membrane** must be brought to the top of the finished floor, except where it is under a *shower screen* where it must terminate not less than 5 mm above the finished tile surface (see Figure 10.2.18 and Figure 10.2.19).
Figure 10.2.29: Typical shower construction

(a) External system-Shower membrane installed before wall sheeting

(b) Internal system-Shower membrane installed after wall sheeting
10.2.30 Membrane to drainage connection

(1) Membrane drainage connections in concrete floors must comply with one of the following:
   (a) The drainage riser must be trimmed to the floor level of the concrete substrate or screed with all internal burrs removed and the waterproofing membrane terminated not less than 20 mm into the riser.
   (b) A drainage flange must be installed with the waterproofing membrane terminated at or in the drainage flange to provide a waterproof connection (see Figure 10.2.30).
   (c) Where a prefabricated shower tray is used, provision must be made to drain the tile bed and provide a waterproof connection to the drain.

(2) Membrane drainage connections in other floors must comply with one of the following:
   (a) The drainage riser must be fixed to the floor substrate and the waterproofing membrane terminated not less than 20 mm into the riser.
   (b) A drainage flange must be installed with the waterproofing membrane terminated at or in the drainage flange to provide a waterproof connection (see Figure 10.2.30).

(3) Where a prefabricated shower tray is used, provision must be made to drain the tile bed and provide a waterproof connection to the drain.

(4) Floor wastes must be of sufficient height to suit the thickness of the tile and tile bed at the outlet position.

Figure 10.2.30: Typical membrane termination at drainage outlet

Explanatory Information: Drainage flanges

1. For membrane drainage connections in concrete floors: drainage flanges may be either cast into the concrete slab or fixed to the top surface of the concrete slab or the tile bed.
2. For membrane drainage connections in other floors: drainage flanges may be either set into the floor or fixed to the top surface of the floor substrate or the tile bed.

10.2.31 Drainage riser connection

(1) Where a preformed shower tray is used, the drainage riser must be connected to the tray with a waterproof joint.

(2) Where an in situ shower tray is used, the membrane must—
   (a) extend not less than 20 mm into the drainage riser or drainage flange; and
   (b) be able to form a permanent waterproof seal to the drainage riser or drainage flange (see Figure 10.2.30).
10.2.32 Door jambs and architraves on tiled floors

Where the bottom of door jambs do not finish above the floor tiling, the portion of the door frame and architrave below the floor tiling must be waterproofed to provide a continuous seal between the perimeter flashing and the waterstop.

10.2.33 Shower screens

1. For an enclosed shower, the shower screen must be designed and installed to prevent water escaping from the shower enclosure.
2. For a shower with a hob, the shower screen must be installed flush with the shower area side of the hob or overhang into the shower area.
3. For a shower with a stepdown, the shower screen must be installed flush with the finished vertical surface of the stepdown of the shower area.
4. For a shower without a hob or stepdown, the shower screen must incorporate or be mounted on an inverted channel, positioned over the top of the waterstop, that defines the shower area.
5. For bath end walls and dividing walls abutting a shower, the shower screen must be positioned so that the bottom edge within the shower area is either flush with the outside edge of the bath or overhanging into the shower area.

Explanatory Information:

A self-draining sub-sill is considered to be part of the shower screen.

10.2.34 Bath end walls abutting a shower

Where a bath end wall is within a shower area, it must be treated as a shower area wall.
### 10.3.1 Height of rooms and other spaces

(1) Heights of rooms and other spaces (see Figure 10.3.1) must be not less than—

(a) in a *habitable room* excluding a kitchen — 2.4 m; and

(b) in a kitchen — 2.1 m; and

(c) in a corridor, passageway or the like — 2.1 m; and

(d) in a bathroom, shower room, laundry, *sanitary compartment*, airlock, pantry, storeroom, garage, car parking area or the like — 2.1 m; and

(e) in a room or space with a sloping ceiling or projections below the ceiling line within—

(i) a *habitable room*—

(A) in an attic — a height of not less than 2.2 m for at least two-thirds of the *floor area* of the room or space; and

(B) in other rooms — a height of not less than 2.4 m over two-thirds of the *floor area* of the room or space; and

(ii) a non-*habitable room* — a height of not less than 2.1 m for at least two-thirds of the *floor area* of the room or space; and

(f) in a stairway, ramp, *landing*, or the like — 2.0 m measured vertically above the nosing line of stairway treads or the floor surface of a ramp, *landing* or the like.

(2) For the purposes of (1)(e), when calculating the *floor area* of a room or space, any part that has a ceiling height of less than 1.5 m is not included.

---

**Figure 10.3.1:** Measurement of heights of rooms and other spaces

---

**Figure Notes:**

The letters in the diagram represent the following minimum dimensions:

- **A** = 2.4 m in a *habitable room* (excluding a kitchen).
B = 2.4 m in a habitable room with a sloping ceiling for at least two-thirds of the floor area of the room or space.

C = 2.1 m in a non-habitable room with a sloping ceiling for at least two-thirds of the floor area of the room or space.

D = 2.2 m in an attic with a sloping ceiling for at least two-thirds of the floor area of the room or space.

E = 1.5 m For the purpose of calculating the floor area of a room or space, any ceiling height of less than 1.5 m is excluded.

F = 2.0 m in a stairway (measured vertically above the nosing line).

The combined dimensions of G must not exceed one-third of the floor area (See E above) of the room or space.

Explanatory Information:

1. Where a room or space has no ceiling lining, the measurement is taken from the floor to the underside of the floor or roof above.

2. In areas unlikely to be occupied for long periods, such as non-habitable rooms, a reduced height of 2.1 m is permitted.

3. 10.3.1(1)(f) permits a reduced height of 2.0 m above stairways, ramps and landings, as these are used for transient purposes and therefore a reduction from the required height in corridors and rooms (2.1 and 2.4 m generally) will not adversely affect occupant safety, health or amenity.
10.4.1 Required facilities

(1) A Class 1 building must be provided with—
   (a) a kitchen sink and facilities for the preparation and cooking of food; and
   (b) a bath or shower; and
   (c) clothes washing facilities, comprising at least one washtub and space in the same room for a washing machine; and
   (d) a closet pan; and
   (e) a washbasin.

(2) If any of the facilities in (1) are detached from the main building, they must be set aside for the exclusive use of the occupants of the building.

Explanatory Information:
1. A kitchen sink or washbasin must not be counted as a laundry washtub. A laundry washtub is considered to provide the necessary means to dispose of waste water as required by H4P3(2).
2. Installation requirements for certain electrical or gas cooking appliances may influence the selection of surrounding materials or the clearance to those materials.

10.4.2 Construction of sanitary compartments

The door to a fully enclosed sanitary compartment must—
   (a) open outwards; or
   (b) slide; or
   (c) be readily removable from the outside of the compartment,

unless there is a clear space of at least 1.2 m, measured in accordance with Figure 10.4.2, between the closet pan within the sanitary compartment and the doorway.
Figure 10.4.2: Construction of sanitary compartments

**Explanatory Information:**

10.4.2 requires means of removing an unconscious occupant from a fully enclosed *sanitary compartment*. If the enclosure has gaps that are large enough to allow access for a person into the *sanitary compartment*, the compartment is not considered enclosed for the purpose of this clause.

*TAS 10.4.3*
10.5.1 Natural light

(1) Natural light must be provided to all habitable rooms, in accordance with the requirements of (2) to (4).

(2) Natural light must be provided by—

(a) windows, excluding roof lights that—

(i) have an aggregate light transmitting area measured exclusive of framing members, glazing bars or other obstructions of not less than 10% of the floor area of the room; and

(ii) are open to the sky or face a court or other space open to the sky or an open verandah, carport or the like; or

(b) roof lights that—

(i) have an aggregate light transmitting area measured exclusive of framing members, glazing bars or other obstructions of not less than 3% of the floor area of the room; and

(ii) are open to the sky; or

(c) a proportional combination of windows and roof lights required by (a) and (b).

(3) A window required to provide natural light that faces a boundary of an adjoining allotment must not be less than a horizontal distance of 900 mm from that boundary.

(4) Natural light to a room may come through one or more glazed panels or openings from an adjoining room (including an enclosed verandah) if—

(a) the glazed panels or openings have an aggregate light transmitting area of not less than 10% of the floor area of the room to which it provides light; and

(b) the adjoining room has—

(i) windows, excluding roof lights that—

(A) have an aggregate light transmitting area of not less than 10% of the combined floor area of both rooms; and

(B) are open to the sky or face a court or other space open to the sky or an open verandah, carport or the like; or

(ii) roof lights that—

(A) have an aggregate light transmitting area of not less than 3% of the combined floor area of both rooms; and

(B) are open to the sky; or

(iii) a proportional combination of windows and roof lights required by (i) and (ii).

(5) The areas specified in (4)(a) and (b) may be reduced as appropriate if direct natural light is provided from another source.

(6) See Figure 10.5.1.
Figure 10.5.1: Method of determining areas of openings for borrowed light

Explanatory Information: Explanatory Figure 10.5.1

A roof light generally receives greater exposure to sunlight than a window because of its orientation to the sky and
consequently, the size of a roof light as a percentage of the floor area served is permitted to be smaller than for a window serving the same floor area. This is explained in Explanatory Figure 10.5.1, below.

**Figure 10.5.1 (explanatory): Method for determining proportional combination of windows and roof lights**

![Diagram of a room with a roof light and a window](image)

**Figure Notes:**
1. Area of the room which requires natural light is 100 m$^2$.
2. No natural light is borrowed from adjoining rooms.

**Explanatory Information: General requirements for Explanatory Figure 10.5.1**

*Required window(s)* to provide natural light must have a light transmitting area of at least 10% of the floor area.

$10\% \times 100 \text{ m}^2 = 10 \text{ m}^2$  
Or, *roof light(s)* to provide natural light must have a light transmitting area of at least 3% of the floor area.

$3\% \times 100 \text{ m}^2 = 3 \text{ m}^2$  
In the formula shown in the next Explanatory Information box, 3% of the floor area is expressed as the fraction $0.03$ and 10% of the floor area is expressed as the fraction $0.1$.

**Explanatory Information: Calculations for Explanatory Figure 10.5.1**

Formula — for the area of *window(s)* required to compensate for *roof light(s)* short fall:
- Area of room covered by the *roof light(s)* = (Area of *roof light(s))* / 0.03
- *Required window(s)* area = $[\text{floor area} - \text{Area covered by the *roof light(s)*}] / 10$

Area of *window(s)* required to compensate for *roof light(s)* short fall:
If the *roof light(s)* = 1 m$^2$
- Area of room covered by the *roof light(s)* = (1 m$^2$ / 0.03) = 33.33 m$^2$.
- *Required window(s)* area = $(100 \text{ m}^2 - 33.33 \text{ m}^2) / 10 = 6.67 \text{ m}^2$.

Formula — for the area of *roof light(s)* required to compensate for *window(s)* short fall:
- Area of room covered by the *window(s)* = (Area of *window(s))* / 0.1.
- *Required roof light(s)* area = $[\text{floor area} - \text{Area covered by the *window(s)*}] / 33.33$. 
Area of roof light(s) required to compensate for window(s) short fall:

If the window(s) = 5 m².

- Area of room covered by the window(s) = (5 m² / 0.1) = 50 m².
- \( \text{Required roof light(s)} \) area = \( (100 \text{ m}^2 - 50 \text{ m}^2) / 33.33 \text{ m}^2 = 1.5 \text{ m}^2 \).

Notes:
1. For the purposes of this example a window excludes a roof light.
2. The same proportional calculation principle applies if—
   a. two or more windows are used; or
   b. two or more roof lights are used.

**Explanatory Information: Natural light borrowed from another source**

1. Direct natural light provided from another source is intended to mean light from a window or roof light in the subject room. As the provision relates to natural light obtained from an adjoining room, “another source” refers to direct natural light provided to the subject room which does not meet the required allowance of either 10% or 3% of the floor area of that room. By not meeting the required amount of natural light, the “direct natural light from another source” can be used as a supplement to the natural light required from an adjoining room.

2. To borrow natural light from another room, 10.5.1(4)(a) allows light to pass through a glazed panel(s) or opening(s) from an adjoining room, which under 10.5.1(4)(b), must have windows, roof lights or a combination of windows and roof lights of a minimum size in proportion to the combined floor areas of both rooms. The minimum size of the glazed panel(s) or opening(s), and the minimum size of the window to the adjoining room are illustrated in Figure 10.5.1.

3. If a doorway is used as an opening to obtain natural light, it must do so when in the closed position (see Figure 10.5.1).

### 10.5.2 Artificial lighting

**Sanitary compartments**, bathrooms, shower rooms, airlocks and laundries must be provided with artificial lighting if natural light in accordance with the relevant provisions of 10.5.1 is not available—

(a) at a rate of not less than one light fitting per 16 m² of floor area; or
(b) in accordance with AS/NZS 1680.0.
10.6.1 Application of Part 10.6

(1) Part 10.6 applies subject to the limitations set out at H4D6.

(2) Part 10.6 need not be complied with if H4D6(1) is complied with.

Explanatory Information:
The requirements of this Part are to be read in conjunction with the condensation management requirements in Part 10.8 and the air movement requirements in Part 13.5. However, it should be noted that Part 13.5 does not apply in all States and Territories.

10.6.2 Ventilation requirements

Ventilation must be provided to a habitable room, sanitary compartment, bathroom, shower room, laundry and any other room occupied by a person for any purpose by any of the following means:

(a) Openings, windows, doors or other devices which can be opened—
   (i) with a ventilating area not less than 5% of the floor area of the room required to be ventilated; and
   (ii) open to—
      (A) a suitably sized court, or space open to the sky; or
      (B) an open verandah, carport, or the like; or
      (C) an adjoining room in accordance with (b).

(b) Natural ventilation to a room may come through a window, opening, door or other device from an adjoining room (including an enclosed verandah) if—
   (i) the room to be ventilated or the adjoining room is not a sanitary compartment; and
   (ii) the window, opening, door or other device has a ventilating area of not less than 5% of the floor area of the room to be ventilated; and
   (iii) the adjoining room has a window, opening, door or other device with a ventilating area of not less than 5% of the combined floor areas of both rooms; and
   (iv) the ventilating areas specified may be reduced as appropriate if direct natural ventilation is provided from another source (See Figure 10.6.2).

(c) An exhaust fan or other means of mechanical ventilation may be used to ventilate a sanitary compartment, laundry, kitchen or bathroom, or where mechanical ventilation is provided in accordance with 10.6.3(b), provided contaminated air exhausts comply with 10.8.2.
Figure 10.6.2: Method of determining areas of openings for borrowed ventilation

Explanatory Information:
The ventilating area of a window is measured as the size of the openable sash of the window. This is the case regardless of the type of window, i.e. whether it is an awning, casement or sliding window and irrespective of the restrictions on the openable sash.

10.6.2(b) permits a room’s required ventilation to be “borrowed” from an adjoining room, i.e. an adjoining room’s ventilation can be used to help make up the total amount of ventilation required.

The use of borrowed ventilation is acceptable if the provisions of 10.6.2(b) are applied to the subject room and to the total area of each relevant room.

10.6.3 Location of sanitary compartments

Sanitary compartments must not open directly into a kitchen or pantry unless—

(a) access is by an airlock, hallway or other room, (see Figure 10.6.3); or
(b) the sanitary compartment is provided with an exhaust fan or other means of mechanical exhaust ventilation.
Figure 10.6.3: Acceptable location of non mechanically ventilated sanitary compartment

Compartment may open directly into kitchen provided mechanical ventilation is provided in accordance with Part 10.6
### 10.7.1 Sound insulation requirements

(1) A *separating wall* between Class 1 buildings, or a wall that separates a Class 1 building from a Class 10a building which is not associated with the Class 1 building must—

(a) have an $R_w + C_{tr}$ (airborne) not less than 50; and

(b) be of *discontinuous construction* if it separates a bathroom, *sanitary compartment*, laundry or kitchen in one Class 1 building from a *habitable room* (other than a kitchen) in an adjoining Class 1 building (see Figure 10.7.1).

(2) For the purposes of (1)(b), *discontinuous construction* means a wall system that has two separate leaves and that is not a staggered stud wall, that complies with the following:

(a) The wall has a minimum 20 mm cavity between leaves.

(b) For masonry walls, where wall ties are *required* to connect leaves, the ties are of the resilient type.

(c) For walls other than masonry, there is no mechanical linkage between leaves except at the periphery.

(3) A wall *required* to have sound insulation must continue to—

(a) the underside of the roof above; or

(b) a ceiling that provides the sound insulation *required* for the wall.

---

*Figure 10.7.1: Required airborne and impact sound insulation — Plan view*

---

---

---
Insulation to reduce both airborne and impact noise transmission is required for parts of a wall that are common to adjoining Class 1 buildings but not parts of a wall located in the subfloor.

### 10.7.2 Determination of airborne sound insulation ratings

The Rw + Ctr sound insulation rating required by 10.7.1(1)(a) must—

(a) be determined in accordance with AS/NZS ISO 717.1, using results from laboratory measurements; or

(b) comply with 10.7.5 to 10.7.8 and the relevant provisions of 10.7.3.

Rw is a measure of airborne sound insulation. Ctr is a spectrum adjustment factor that adjusts for low frequency sound levels. Ctr has been chosen in recognition of the problems caused by the high bass frequency outputs of modern home theatre systems and music reproduction equipment used by occupants of Class 1 buildings.

The wall configurations described in 10.7.5 to 10.7.8 are typical examples. Other proprietary methods are available via testing to AS/NZS ISO 717.1 for meeting the Rw + Ctr requirements of 10.7.1.

### 10.7.3 Construction of sound insulated walls

To achieve the appropriate level of sound insulation, walls must be constructed as follows:

(a) Stud wall junction — junctions of sound insulated walls with any perimeter walls and roof cladding must be sealed in accordance with Figure 10.7.3a.

(b) Masonry — units must be laid with all joints filled solid, except for articulation joints complying with 5.6.8 and 5.2.13, including those between the masonry and any adjoining construction.

(c) Concrete panels — must have joints between panels and any adjoining construction filled solid.

(d) Plasterboard sheeting —

(i) If two layers are required, the second layer joints must not coincide with those of the first layer (see Figure 10.7.3b).

(ii) Joints between sheets including the outer layer or between sheets and any adjoining construction must be taped and filled solid.

(e) Steel framed construction — steel framing and perimeter members must be installed as follows:

(i) Steel framing members must be not less than 0.6 mm thick.

(ii) Studs must be not less than 63 mm in depth unless another depth is specified in 10.7.5 to 10.7.8.

(iii) All steel members at the perimeter of the wall must be securely fixed to the adjoining structure and the joints must be caulked so that there are no voids between the steel members and the wall.

(f) Timber-framed construction — timber studs and perimeter members must be installed as follows:

(i) Noggings and like members must not bridge between studs supporting different wall leaves.

(ii) All timber members at the perimeter of the wall must be securely fixed to the adjoining structure and the joints must be caulked so there are no voids between the timber members and the wall.

(b) Plan

Mineral fibre or other suitable fire resistant material
Figure 10.7.3b: Typical installation of plaster sheets for sound insulation

(a) Second layer positioned vertically

(b) Second layer positioned horizontally
10.7.4 Services

(1) Services must not be chased into concrete or masonry separating walls.

(2) If a duct, soil, waste, water supply or storm water pipe is located in a separating wall—
   (a) a door or panel providing access to a duct or pipe required to be separated must—
      (i) not open into any habitable room, other than a kitchen; and
      (ii) in any other part must be firmly fixed so as to overlap the frame or rebate of the frame by not less than 10 mm and be constructed of—
         (A) wood, plasterboard or blockboard not less than 33 mm thick; or
         (B) compressed fibre reinforced cement sheeting not less than 9 mm thick; or
         (C) other suitable material with a mass per unit area not less than 24.4 kg/m²; and
   (b) in the case of a water supply pipe, it must—
      (i) only be installed in discontinuous construction; and
      (ii) in the case of a water supply pipe that serves one dwelling, not be fixed to the wall leaf on the side of any other dwelling and have a clearance not less than 10 mm to the other wall leaf.

(3) Electrical outlets must be offset from each other—
   (a) in masonry walling, not less than 100 mm; and
   (b) in timber or steel-framed walling, not less than 300 mm.

10.7.5 Acceptable forms of construction for masonry walls

(1) Acceptable forms of construction for masonry walls are set out in (2) to (6).

(2) Two leaves of 110 mm clay brick masonry with—
   (a) cavity not less than 50 mm between leaves; and
   (b) 50 mm thick glass wool insulation with a density of 11 kg/m³ or 50 mm thick polyester insulation with a density of 20 kg/m³ in the cavity,
   with an R_w + C_tr of not less than 50, constructed in accordance with Figure 10.7.5a.

(3) Two leaves of 110 mm clay brick masonry with—
   (a) cavity not less than 50 mm between leaves; and
   (b) 13 mm cement render on each outside face,
   with an R_w + C_tr of not less than 50, constructed in accordance with Figure 10.7.5b.

(4) Single leaf of 110 mm clay brick masonry with—
   (a) a row of 70 mm x 35 mm timber studs or 64 mm steel studs at 600 mm centres, spaced 20 mm from the masonry wall; and
   (b) 50 mm thick mineral insulation or glass wool insulation with a density of 11 kg/m³ positioned between studs; and
   (c) one layer of 13 mm plasterboard fixed to outside face of studs and outside face of masonry,
   with an R_w + C_tr of not less than 50, constructed in accordance with Figure 10.7.5c.

(5) Single leaf of 90 mm clay brick masonry with—
   (a) a row of 70 mm x 35 mm timber studs or 64 mm steels studs at 600 mm centres, spaced 20 mm from each face of the masonry wall; and
   (b) 50 mm thick mineral insulation or glass wool insulation with a density of 11 kg/m³ positioned between studs in each row; and
   (c) one layer of 13 mm plasterboard fixed to studs on each outside face,
with an $R_w + C_y$ of not less than 50, constructed in accordance with Figure 10.7.5d.

(6) Single leaf of 220 mm brick masonry with 13 mm cement render on each face with an $R_w + C_y$ of not less than 50, constructed in accordance with Figure 10.7.5e.

Figure 10.7.5a: Two leaves of 110 mm clay brick masonry (method 1)

Figure 10.7.5b: Two leaves of 110 mm clay brick masonry (method 2)

10.7.6 Acceptable forms of construction for concrete walls

(1) Acceptable forms of construction for concrete walls are set out in (2) to (5).

(2) 150 mm thick plain off form concrete, with an R\(_w\) + C\(_f\) of not less than 50, constructed in accordance with Figure 10.7.6a.

(3) 200 mm thick concrete panel with one layer of 13 mm plasterboard or 13 mm cement render on each face, with an R\(_w\) + C\(_f\) of not less than 50, constructed in accordance with Figure 10.7.6b.

(4) 100 mm thick concrete panel with—
   (a) a row of 64 mm steel studs at 600 mm centres, spaced 25 mm from the concrete panel; and
   (b) 80 mm thick polyester insulation or 50 mm thick glass wool insulation with a density of 11 kg/m\(^3\), positioned between studs; and
   (c) two layers of 13 mm plasterboard fixed to outside face of studs and one layer of 13 mm plasterboard fixed to outside face of concrete panel,
   with an R\(_w\) + C\(_f\) of not less than 50, constructed in accordance with Figure 10.7.6c.

(5) 125 mm thick concrete panel with—
   (a) a row of 64 mm steel studs at 600 mm centres, spaced 20 mm from the concrete panel; and
   (b) 70 mm polyester insulation with a density of 9 kg/m\(^3\), positioned between studs; and
   (c) one layer of 13 mm plasterboard fixed to the outside face of the studs,
   with an R\(_w\) + C\(_f\) of not less than 50, constructed in accordance with Figure 10.7.6d.
10.7.7 Acceptable forms of construction for autoclaved aerated concrete walls

[2019: Table 3.8.6.1c]

(1) Acceptable forms of construction for autoclaved aerated concrete walls are set out in (2) to (4).

(2) 75 mm thick autoclaved aerated concrete wall panel with—
(a) a row of 64 mm steel studs at 600 mm centres, spaced 20 mm from the autoclaved aerated concrete wall panel; and

(b) 75 mm thick glass wool insulation with a density of 11 kg/m$^3$ positioned between studs; and

(c) one layer of 10 mm moisture resistant plasterboard or 13 mm fire protective grade plasterboard fixed to outside face of studs and outside face of autoclaved aerated concrete wall panel, with an $R_w + C_v$ of not less than 50, constructed in accordance with Figure 10.7.7a.

(3) 75 mm thick autoclaved aerated concrete wall panel with—

(a) a row of 64 mm steel studs at 600 mm centres, spaced 35 mm from the autoclaved aerated concrete panel wall; and

(b) 28 mm metal furring channels fixed to the outside face of the autoclaved aerated concrete wall panel, with 50 mm thick polyester insulation with a density of 9 kg/m$^3$ positioned between furring channels and one layer of 13 mm fire protective grade plasterboard fixed to furring channels; and

(c) 105 mm thick glass wool insulation with a density of 7 kg/m$^3$ positioned between studs; and

(d) one layer of 13 mm fire protective grade plasterboard fixed to the outside face of the studs, with an $R_w + C_v$ of not less than 50, constructed in accordance with Figure 10.7.7b.

(4) Two leaves of 75 mm autoclaved aerated concrete wall panel with—

(a) a cavity not less than 30 mm between panels containing 50 mm glass wool insulation with a density of 11 kg/m$^3$; and

(b) one layer of 10 mm plasterboard fixed to outside face of each panel, with an $R_w + C_v$ of not less than 50, constructed in accordance with Figure 10.7.7c.

Figure 10.7.7a: 75 mm thick autoclaved aerated concrete wall panel (method 1)
Acceptable forms of construction for timber and steel framed walls

(1) Acceptable forms of construction for timber and steel framed walls are set out in (2) and (3).

(2) Two rows of 90 x 35 mm timber studs or two rows of 64 mm steels studs at 600 mm centres with—
   (a) an air gap not less than 20 mm between the rows of studs; and
   (b) 50 mm thick glass wool insulation or 60 mm thick polyester insulation with a density of 11 kg/m³; positioned between one row of studs, and
   (c) two layers of 13 mm fire protective grade plasterboard or one layer of 6 mm fibre cement sheet and one layer of 13 mm fire protective grade plasterboard, fixed to outside face of studs, with an $R_w + C_r$ of not less than 50, constructed in accordance with Figure 10.7.8a.

(3) Two rows of 64 mm steel studs at 600 mm centres with—
   (a) an air gap not less than 80 mm between the rows of studs; and
   (b) 200 mm thick polyester insulation with a density of 14 kg/m³ positioned between studs; and
one layer of 13 mm fire-protective grade plasterboard and one layer 13 mm plasterboard on one outside face
and one layer of 13 mm fire-protective grade plasterboard on the other outside face,
with an $R_w + C_f$ of not less than 50, constructed in accordance with Figure 10.7.8b.

**Figure 10.7.8a:** Two rows of 90 mm x 35 mm timber studs or two rows of 64 mm steels studs at 600 mm centres

**Figure 10.7.8b:** Two rows of 64 mm steel studs at 600 mm centres
10.8.1 Pliable building membrane

(1) Where a *pliable building membrane* is installed in an *external wall*, it must—
   (a) comply with AS/NZS 4200.1; and
   (b) be installed in accordance with AS 4200.2; and
   (c) be a vapour permeable membrane for *climate zones* 6, 7 and 8; and
   (d) be located on the exterior side of the primary insulation layer of wall assemblies that form the external envelope of a building.

(2) Except for single skin masonry or single skin concrete, where a *pliable building membrane* is not installed in an *external wall*, the primary *water control layer* must be separated from *water sensitive materials* by a drained cavity.

10.8.2 Flow rate and discharge of exhaust systems

(1) An exhaust system installed in a kitchen, bathroom, *sanitary compartment* or laundry must have a minimum flow rate of—
   (a) 25 L/s for a bathroom or *sanitary compartment*; and
   (b) 40 L/s for a kitchen or laundry.

(2) Exhaust from a bathroom, *sanitary compartment*, or laundry must be discharged—
   (a) directly or via a shaft or duct to *outdoor air*; or
   (b) to a roof space that is ventilated in accordance with 10.8.3.

10.8.3 Ventilation of roof spaces

(1) Where an exhaust system covered by 10.8.2 discharges into a roof space, the roof space must be ventilated to *outdoor air* through evenly distributed openings.

(2) Openings *required* by (1) must have a total unobstructed area of 1/300 of the respective ceiling area if the roof pitch is more than 22°, or 1/150 of the respective ceiling area if the roof pitch is not more than 22°.

(3) 30% of the total unobstructed area *required* by (2) must be located not more than 900 mm below the ridge or highest point of the roof space, measured vertically, with the remaining *required* area provided by eave vents.

11.3.6 Construction of wire barriers
11.3.7 Protection of openable windows – bedrooms
11.3.8 Protection of openable windows – rooms other than bedrooms
11.1 Scope

This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for—

(a) stairway and ramp construction (see Part 11.2); and

(b) barriers and handrails (see Part 11.3).

11.2 Application

The application of Section 11 of the ABCB Housing Provisions is subject to the following:

(a) The Governing Requirements of NCC 2022 Volume Two.

(b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:
In NCC 2019, the content of Section 11 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.9.1 and 3.9.2 of NCC 2019 Volume Two.
11.2.1 Explanation of terms

(1) Figure 11.2.1 depicts stairway members and associated terminology used to describe them in the ABCB Housing Provisions.

(2) Some items such as barriers and handrails have been omitted for clarity.

Figure 11.2.1: Stairway terms

(a) Quarter landing stairway – 2 flights
(b) Continuous stairway – 1 flight
(90° change in direction)

Explanatory Information: Alpine areas
The requirements of this Part are to be read in conjunction with Part 12.2 where a building is located in an alpine area and contains an external stairway or ramp.

Explanatory Information: Room heights
Part 10.3 contains the required height for a ceiling above a stairway, ramp or landing, measured vertically above the nosing line of stairway treads or the floor surface of a ramp or landing.

11.2.2 Stairway construction

(1) A stairway must be designed to take loading forces in accordance with AS/NZS 1170.1 and must have—

(a) not more than 18 and not less than 2 risers in each flight; and

(b) Goings (G), risers (R) and a slope relationship quantity \(2R + G\) in accordance with Table 11.2.2a, except as permitted by (2) and (3); and

(c) constant goings and risers throughout each flight, except as permitted by (3) and (4), and the dimensions of
Safe movement and access

**ABCB Housing Provisions Standard 2022**

**Page 576**

Goings (G) and risers (R) in accordance with (1), (2) and (3) are considered constant if the variation between—

(i) adjacent risers, or between adjacent goings, is no greater than 5 mm; and

(ii) the largest and smallest riser within a flight, or the largest and smallest going within a flight, does not exceed 10 mm; and

(d) risers which do not have any openings that would allow a 125 mm sphere to pass through between the treads; and

(e) treads of solid construction (not mesh or other perforated material) if the stairway is more than 10 m high or connects more than 3 storeys.

(2) In the case of a stairway serving only non-habitable rooms, such as attics, storerooms and the like that are not used on a regular or daily basis—

(a) the going (G), riser (R) and slope relationship quantity (2R + G) in accordance with Table 11.2.2a may be substituted with those in Table 11.2.2b; and

(b) need not comply with (1)(d).

(3) In the case of a stairway with winders—

(a) a maximum of 3 consecutive winders in lieu of a quarter landing in a flight and a maximum of 6 consecutive winders in lieu of a half landing in a flight; and

(b) the going (G) of all winders in lieu of a quarter or half landing may vary from the going of the straight treads within the same flight provided that the going (G) of such winders is constant.

(4) The point of measurement of the going (G) in the slope relationship quantity (2R + G) for tapered treads and treads in spiral stairways as described in Table 11.2.2a (see Figure 11.2.2a to Figure 11.2.2c) must be—

(a) for tapered treads, other than treads in a spiral stairway—

(i) not more than 1 m in width, the middle of the unobstructed width of the stairway (see Figure 11.2.2b); and

(ii) more than 1 m in width, 400 mm from the unobstructed width of each side of the stairway (see Figure 11.2.2c); and

(b) for treads in spiral stairways, the point seven tenths of the unobstructed width from the face of the centre pole or support towards the handrail side (see Figure 11.2.2d and Figure 11.2.2e).

(5) Riser and going dimensions must be measured in accordance with Figure 11.2.2f.

**Table 11.2.2a:**

7/10
11.2.2(1)(a) states that a stairway must have not more than 18 and not less than 2 risers in each flight. Where there are less than 2 risers in a flight, it does not comprise a stairway for the purpose of the NCC. 18 risers is considered to be the maximum reasonable number that an average person can negotiate before requiring a rest. Winders are counted as part of the maximum number of 18 risers. More than 1 riser is considered necessary for a person to observe and adjust to a change in level.

**Explanatory Information: Going and riser dimensions**

The purpose of 11.2.2 is to achieve constant going and riser dimensions deemed safe for people to walk up and down. This minimises the risk of people overstepping during descent on uneven stairs (due to short goings) and tripping on ascent (due to high risers). Table 11.2.2a and Table 11.2.2b express ratios between going and riser dimensions which are considered safe for use. 11.2.2(1)(c) accounts for conditions such as movement of materials due to atmospheric moisture changes or minor deviations related to variations in materials which affect finished stair dimensions.

Explanatory Figure 11.2.2a illustrates adjacent risers within a flight with minor deviations in the materials affecting the finished stair dimensions. The nominated riser height is exceeded by riser A. As a consequence riser height B is less than the nominated riser height. The difference between riser A and riser B cannot exceed 5 mm.

Explanatory Figure 11.2.2b illustrates an entire flight with minor deviations in the materials affecting the finished riser dimensions. In addition to the 5 mm difference permitted between adjacent goings or risers, the maximum difference
between the smallest and largest *going* or *riser* within a *flight* must not exceed 10 mm. Despite the deviations shown in both diagrams, the stairs in the *flight* are deemed constant. Irrespective of any minor deviations permitted by 11.2.2(1)(c), finished *going* and *riser* dimensions must not exceed the limitations stipulated in Table 11.2.2a.

**Figure 11.2.2a (explanatory):** Minor deviations in a stairway — deviation in adjacent risers

**Figure Notes:**
1. $A$ = larger *riser* of two adjacent *riser*.
2. $B$ = smaller *riser* of two adjacent *riser*.
3. This diagram only shows deviations in *risers*, however the same principle can apply for *goings*.

**Figure 11.2.2b (explanatory):** Minor deviations in a stairway – deviations over a flight

**Figure Notes:**
1. $C$ = largest *riser* of the *flight*.
2. $D$ = smallest *riser* of the *flight*.
3. This diagram only shows deviations in *risers*, however the same principle can apply for *goings*.

**Explanatory Information: Openings in stair risers**

11.2.2(1)(d) allows the use of open *riser* stairs. However, it limits the openings to 125 mm to minimise the risk of a person (especially a young child) falling through the opening created by the open *riser*. 
Explanatory Information: Solid treads
11.2.2(1)(e) specifies a height where solid treads must be used so that people cannot see through them. This minimises the risk of people being affected by vertigo.

Explanatory Information: Stairways with winders
1. 11.2.2(3) allows the use of winders in stairways. However, 11.2.2(3) places a restriction on the number of allowable winders in a stairway flight, this restriction would apply equally to not permit a stairway incorporating a consecutive series of winders in a flight.
2. This also means the maximum number of consecutive winders in any stairway flight is 6.

11.2.3 Ramps

An external ramp serving an external doorway or a ramp within a building must—

(a) be designed to take loading forces in accordance with AS/NZS 1170.1; and
(b) have a gradient not steeper than 1:8; and
(c) be provided with landings complying with 11.2.5 at the top and bottom of the ramp and at intervals not greater than 15 m.

Notes: Livable housing design
Where an external ramp is provided for the purposes of compliance with the ABCB Standard for Livable Housing Design, the requirements of that Standard override the requirements of 11.2.3.

Explanatory Information:
In relation to external ramps, 11.2.3 applies to a ramp serving an external door. For the purpose of 11.2.3 a driveway is not considered to be a ramp.

11.2.4 Slip resistance

(1) The requirements for slip-resistance treatment to stair treads, ramps and landings are as set out in (2), (3) and (4).
(2) Treads must have—
   (a) a surface with a slip-resistance classification not less than that listed in Table 11.2.4 when tested in accordance with AS 4586; or
   (b) a nosing strip with a slip-resistance classification not less than that listed in Table 11.2.4 when tested in accordance with AS 4586.
(3) The floor surface of a ramp must have a slip-resistance classification not less than that listed in Table 11.2.4 when tested in accordance with AS 4586.
(4) Landings, where the edge leads to the flight below, must have—
   (a) a surface with a slip-resistance classification not less than that listed in Table 11.2.4 when tested in accordance with AS 4586, for not less than 190 mm from the stair nosing; or
   (b) a nosing strip with a slip-resistance classification not less than that listed in Table 11.2.4 when tested in accordance with AS 4586.

Explanatory Information:
1. To determine the appropriate surface of a tread or the floor surface of a ramp, it is necessary to determine the likely conditions the tread or ramp will be subject to over the life of the building. This can be either dry, wet or both. A dry surface is one that is not normally wet or likely to be made wet other than by an accidental spill. A wet surface is
one that is normally wet or likely to be made wet, including areas exposed to the weather.

2. Under 11.2.4(2) stair treads must have a surface or nosing strip which minimises the risk of people slipping and injuring themselves. In each case the surface or nosing must have a slip-resistance classification when tested in accordance with AS 4586. There are two tests (the Wet Pendulum Test or the Oil-Wet Inclining Platform Test) and two conditions (dry or wet) to be considered.

3. Under 11.2.4(3) the floor surface of a ramp must be slip-resistant to minimise the risk of people slipping and injuring themselves. The surface must have a slip-resistance classification when tested in accordance with AS 4586.

11.2.5 Landings

[2019: 3.9.1.5]

(1) **Landings** must—

(a) be not less than 750 mm long and where this involves a change in direction, the length is measured 500 mm from the inside edge of the landing (see Figure 11.2.5a); and

(b) have a gradient not steeper than 1:50; and

(c) be provided where the sill of a threshold of a doorway opens onto a stairway or ramp that provides a change in floor level or floor to ground level greater than 3 risers or 570 mm (see Figure 11.2.5b); and

(d) extend across the full width of a doorway.

(2) In the case of a stairway serving only non-habitable rooms, such as attics, storerooms and the like that are not used on a regular or daily basis, the requirements of (1)(a) may be substituted with a minimum length of landing being not less than 600 mm long.

Figure 11.2.5b: Threshold landing

Explanatory Information: Purpose of a landing
The purpose of a landing is to provide a rest area for people using the stairway or ramp, and to allow the stairway or ramp to change direction if needed.

Explanatory Information: Minimum landing length
The minimum length of a landing allows people using a stairway or ramp to rest, and reduces the risk of people falling more than one flight of stairs.

Explanatory Information: Maximum grade of 1:50
The maximum grade of 1 in 50 required under 11.2.5(1)(b) makes sure that the landing is as level as possible, but still allows a slight slope for drainage if necessary.

11.2.6 Thresholds

Where the threshold of a doorway is more than 230 mm above the adjoining surface it must incorporate steps having riser (R) and going (G) dimensions in accordance with 11.2.2.
11.3.1 Application of Part 11.3

Compliance with Part 11.3 is achieved by complying with—

(a) 11.3.2, 11.3.3 and 11.3.5 for barriers to prevent falls; and
(b) 11.3.4 for handrails; and
(c) 11.3.6 and 11.3.7 for protection of openable windows.

Explanatory Information: External trafficable structures

For a required barrier to an external trafficable structure in an alpine area, the requirements of this Part need to be read in conjunction with the requirements of Part 12.2.

Explanatory Information: Swimming pools

Safety barrier requirements for swimming pools are contained in H7D2.

Explanatory Information: Additional requirements

In addition to the requirements of this Part, a barrier and handrail must comply with the structural requirements of Part 2.2. The structural requirements refer to the barrier and/or handrail being designed and constructed to withstand any combinations of loads and other actions to which it may reasonably be subjected and the structural resistance of the materials and forms of construction used for the barrier or handrail.

A window forming a part of a barrier must comply with the glazing assembly provisions of Section 8, and therefore is not required to comply with AS/NZS 1170.1 (structural design actions - referenced in Part 2.2) as it is exempted by Section 8. The Section 8 provisions consider the wind loading on the glazing and human impact requirements.

11.3.2 Explanation of terms

(1) Figure 11.3.2 depicts typical stairway and barrier members and associated terminology.

(2) Some items have been omitted for clarity.

12. Barrier

11.3.3 Barriers to prevent falls

[2019: 3.9.2.2]

(1) A continuous barrier must be provided along the side of a trafficable surface, such as—
   (a) a stairway, ramp or the like; and
   (b) a floor, corridor, hallway, balcony, deck, verandah, mezzanine, access bridge or the like; and
   (c) a roof top space or the like to which general access is provided; and
   (d) any delineated path of access to a building,
   where it is possible to fall 1 m or more measured from the level of the trafficable surface to the surface beneath (see Figure 11.3.3a).

(2) The requirements of (1) do not apply to—
   (a) a retaining wall unless the retaining wall forms part of, or is directly associated with, a delineated path of access to a building from the road, or a delineated path of access between buildings (see Figure 11.3.3b); or
   (b) a barrier provided to an openable window covered by 11.3.7 and 11.3.8.

Figure 11.3.3a: Barriers — when required

(a) Barrier not required
(b) Barrier required
11.3.3 Safe movement and access

Figure 11.3.3b: Barriers — when required for retaining walls

Explanatory Information: Intent
The intent of the barrier requirements is to prescribe provisions to minimise the risk of a person falling from a stairway, raised floor level (such as a balcony) or the like. 11.3.3 sets out when barriers are required to be provided and 11.3.4 contains the requirements for the construction of barriers.

Explanatory Information: Barriers and children
Children are at particular risk of falling off, over or through ineffectively designed or constructed barriers. Accordingly the requirements of this Part aim to ensure that a barrier reduces the likelihood of children being able to climb over a barrier or fall through a barrier.

11.3.4 Construction of barriers to prevent falls

[2019: 3.9.2.3]

(1) A barrier required by 11.3.3 must comply with (2) to (10).

(2) The height of a barrier must be in accordance with the following:

(a) The height must not be less than 865 mm above the nosings of the stair treads, the floor of a ramp or the like (see Figure 11.3.4a).

(b) The height must not be less than—

(i) 1 m above the floor of any landing, corridor, hallway, balcony, deck, verandah, access path, mezzanine, access bridge, roof top space or the like to which general access is provided (see Figure 11.3.3b and Figure 11.3.4a); or

(ii) 865 mm above the floor of a landing to a stairway or ramp where the barrier is provided along the inside
edge of the landing and does not exceed a length of 500 mm.

(3) A transition zone may be incorporated where the barrier height changes from 865 mm on the stairway flight or ramp to 1 m at the landing (see Figure 11.3.4b).

(4) Openings in barriers (including decorative balustrades) must be constructed so that they do not permit a 125 mm sphere to pass through it and for stairways, the opening is measured above the nosing line of the stair treads (see Figure 11.3.4b).

(5) Where a barrier is fixed to the face of a landing, balcony, deck or the like, the opening between the barrier and the face must not permit a 40 mm sphere to pass through.

(6) A barrier to a stairway serving a non-habitable room, such as an attic, storeroom or the like that is not used on a regular or daily basis, need not comply with (4) if—

(a) openings are constructed so that they do not permit a 300 mm sphere to pass through; or

(b) where rails are used, the barrier consists of a top rail and an intermediate rail, with the openings between rails not more than 460 mm.

(7) Restriction on horizontal elements:

(a) Where it is possible to fall more than 4 m, any horizontal elements within the barrier between 150 mm and 760 mm above the floor must not facilitate climbing.

(b) For the purpose of (a), the 4 m is measured from the floor level of the trafficable surface to the surface beneath.

(7) A barrier constructed of wire is deemed to meet the requirements of (4) if it is constructed in accordance with 11.3.6.

(8) A glass barrier or window serving as a barrier must comply with H1D8 and the relevant provisions of this Part.

(9) A barrier, except a window serving as a barrier, must be designed to take loading forces in accordance with AS/NZS 1170.1.
11.3.5 Handrails

(1) Handrails to a stairway or ramp must—
   (a) be located along at least one side of the stairway flight or ramp; and
   (b) be located along the full length of the stairway flight or ramp, except in the case where a handrail is associated with a barrier the handrail may terminate where the barrier terminates; and
   (c) have the top surface of the handrail not less than 865 mm vertically above the nosings of the stair treads or the floor surface of the ramp (see Figure 11.3.4b); and
   (d) be continuous and have no obstruction on or above them that will tend to break a handhold, except for newel posts, ball type stanchions, or the like.

(2) The requirements of (1) do not apply to—
   (a) a stairway or ramp providing a change in elevation of less than 1 m; or
   (b) a landing; or
   (c) a winder where a newel post is installed to provide a handhold.

Explanatory Information:

1. 11.3.5 addresses requirements regarding location, height and extent of handrails. Where a barrier and handrail are installed together, 11.3.5 is to be read in conjunction with 11.3.3, 11.3.4 and 11.3.6.

2. A handrail is required on at least one side of the stairway flight or ramp. The top rail of a barrier may be suitable as a handrail if it meets 11.3.5 and is able to be grasped by hand to provide support to the person using the stairway.
or ramp.

3. 11.3.5(1)(b) requires a continuous handrail which must extend the full length of the stairway flight or ramp except where the handrail is associated with the barrier, in which case the handrail can terminate where the barrier is allowed to terminate. This allows for the barriers to geometric stairways such as elliptical, spiral, circular or curved stairways to finish a few treads from the bottom of the stairway.

4. 11.3.5(1)(c) requires a minimum handrail height of 865 mm. This height provides comfort, stability, support and assistance for most users.

5. 11.3.5(2) outlines where a handrail need not be provided, this includes—
   a. where a stairway or ramp is providing a change in elevation less than 1 m; or
   b. a landing for a stairway or ramp; or
   c. winder in a stairway if a newel post is installed to provide a handhold.

### 11.3.6 Construction of wire barriers

[2019: 3.9.2.5]

1. A wire barrier is deemed to meet the requirements of 11.3.4(4) if it is constructed in accordance with (2) to (4).

2. For a horizontal or near horizontal wire system—
   (a) when measured with a strain indicator, it must be in accordance with the tension values in Table 11.3.6a; or
   (b) when measured for a maximum permissible deflection, it must not exceed the maximum deflections in Table 11.3.6b.

3. For a non-continuous vertical wire system—
   (a) when measured with a strain indicator, it must be in accordance with the tension values in Table 11.3.6a (see Note 4); or
   (b) when measured for maximum permissible deflection, it must not exceed the maximum deflections in Table 11.3.6b.

4. For a continuous vertical or continuous near vertical sloped wire system—
   (a) it must have wires of no more than 2.5 mm diameter with a lay of 7 x 7 or 7 x 19 construction; and
   (b) changes in direction at support rails must pass around a pulley block without causing permanent deformation to the wire; and
   (c) supporting rails must be spaced of not more than 900 mm apart and be of a material that does not allow deflection that would decrease the tension of the wire under load; and
   (d) when the wire tension is measured with a strain indicator, it must be in accordance with the tension values in Table 11.3.6c when measured in the furthermost span from the tensioning device.

### Table 11.3.6a: Wire barrier construction – Minimum required tension (N) for stainless steel horizontal wire

| Wire dia. (mm) | Lay | Wire spacing (mm) | Clear distance between posts (mm) | 600 | 800 | 900 | 1000 | 1200 | 1500 | 1800 | 2000 | 2500 |
|---------------|-----|------------------|----------------------------------|-----|-----|-----|-------|------|------|------|------|------|------|
| 2.5           | 7x7 | 60               | 55                               | 190 | 263 | 415 | 478   | 823  | 1080 | 1139 | x    | x    |
|               |     | 80               | 382                              | 630 | 730 | 824 | 1025  | 1288 | x    | x    | x    | x    |
|               |     | 100              | 869                              | 1218| 1368| x   | x     | x    | x    | x    | x    | x    |
| 2.5           | 1x19| 60               | 35                               | 218 | 310 | 402 | 585   | 810  | 1125 | 1325 | x    | x    |
|               |     | 80               | 420                              | 630 | 735 | 840 | 1050  | 1400 | 1750 | x    | x    | x    |
|               |     | 100              | 1140                            | 1565| x   | x   | x     | x    | x    | x    | x    | x    |
| 3.0           | 7x7 | 60               | 15                               | 178 | 270 | 314 | 506   | 660  | 965  | 1168 | 1491 | x    |
|               |     | 80               | 250                              | 413 | 500 | 741 | 818   | 1083 | 1370 | 1565 | x    | x    |
### Table Notes:

1. Lay = number of strands by the individual wires in each strand. For example a lay of 7 x 19 consists of 7 strands with 19 individual wires in each strand.

2. Where a change of direction is made in a run of wire, the tensioning device is to be placed at the end of the longest span.

3. If a 3.2 mm diameter wire is used, the tension figures for 3.0 mm wire are applied.

4. This table may also be used for a set of non-continuous (single) vertical wires forming a barrier using the appropriate clear distance between posts as the vertical clear distance between the rails.

5. X = not allowed because the required tension would exceed the safe load of the wire.

6. Tension measured with a strain indicator.

### Table 11.3.6b: Continuous wire barrier construction – Maximum permissible deflection of each wire in mm when a 2 kg mass is suspended at mid-span for stainless steel wires

<table>
<thead>
<tr>
<th>Wire dia. (mm)</th>
<th>Wire spacing (mm)</th>
<th>Clear distance between posts (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>600</td>
</tr>
<tr>
<td>2.5</td>
<td>60</td>
<td>17</td>

<td>60</td>
<td>18</td>
</tr>
<tr>
<td></td>
<td>80</td>
<td>8</td>
</tr>
</tbody>
</table>

### Table Notes:

1. Where a change of direction is made in a run of wire, the 2 kg mass must be placed at the middle of the longest span.

2. If a 3.2 mm diameter wire is used, the deflection figures for a 3.0 mm wire are applied.

3. This table may also be used for a set of non-continuous (single) vertical wires forming a barrier using the appropriate clear distance between posts as the vertical clear distance between the rails.

4. The deflection (offset) is measured by hooking a standard spring scale to the mid span of each wire and pulling it horizontally until a force of 19.6 N is applied.

5. X = not allowed because the required tension would exceed the safe load of the wire.
6. This table has been limited to 60 mm and 80 mm spaces for 2.5 mm, 3 mm and 4 mm diameter wires because the required wire tensions at greater spacings would require the tension to be beyond the wire safe load limit, or the allowed deflection would be impractical to measure.

Table 11.3.6c: Continuous wire barrier construction—Minimum required tension (N) for vertical or near-vertical stainless steel wires where the maximum clear spacing between the rails is 900mm

</tr>
</tbody>
</table>

Table Notes:
1. Lay = number of strands by the number of individual wires in each strand. For example a lay of 7 x 19 consists of 7 strands with 19 individual wires in each strand.
2. Vertical wires must have two pulley blocks to each 180 degree change of direction in the wire.
3. Near vertical wires may only require one pulley block for each change of direction.
4. Wire tension measured with a strain indicator.
5. The table only includes 7 x 7 and 7 x 19 wires due to other wires not having sufficient flexibility to make the necessary turns.

Explanatory Information:
1. For the purpose of 11.3.6, a wire barrier consists of a series of tensioned wire rope connected to either vertical or horizontal supports serving as a guard to reduce the risk of a person falling from a roof, stairway, raised floor level or the like.
2. To assist in the application of 11.3.6, the following terms are explained:
   a. Continuous - where the wire spans three or more supports.
   b. Non-continuous - where the wire only spans between two supports.
   c. Pulley block - a device consisting of a wheel in which a wire runs around to change its direction.
   d. Permissible deflection - is the allowable bending of the wire.
   e. Support rails - are horizontal components of the barrier system that span across the top and bottom to provide structural support.
3. Tables 11.3.6a and 11.3.6c contain tension requirements for wires in vertical and horizontal wire barrier systems with varying post spacings, wire spacings and wire types, whereas Table 11.3.6b contains deflection requirements for use in horizontal and vertical barrier systems. The figures contained in the tables were derived from testing the spacing combinations in order to prevent the passage of a 125 mm diameter solid cone penetrating between the wires at a predetermined force.
4. It is important to read the notes to the Tables as they provide additional information on their application to horizontal, vertical and near vertical wire barriers.
5. Wire barriers deflect under loading conditions, even when tightly tensioned. This is particularly relevant over the service life of the barrier as the wire tends to lose its tension. Therefore, care needs to be taken to ensure that wire tension will be maintained during the life of the barrier. In some situations, it may be necessary to incorporate “lock-off” devices to prevent loosening of the wire. Likewise, if a threaded anchor bears against a soft wood post or rail, the anchor may indent the post or rail, thus loosening the wire.
6. Temperature effects on the tension of the wire may be significant but there is little that can be done to allow for temperature variation in service. The shorter the wire span, the lesser the effect will be.
7. Stainless steel wire with a lay of 1 x 19 has the greatest elastic modulus and will take up the same load with less extension than equivalent wires with other lays.

8. A wire barrier excludes wire mesh fences and the like.

9. Sharp ends of wires at terminations and swages need to be removed for the safety of children and other people. No wire end should protrude more than half the diameter of the wire from the swage or termination fitting.

10. It should be noted that 11.3.6 is only one form of compliance solution which can be used to demonstrate compliance with H5P2(2)(c) and (d). The following means of verification are available:

   a. H5V1.

   b. The *Deemed-to-Satisfy Provisions* in 11.3.6.

   c. A *Performance Solution* that uses one of the other NCC *Assessment Methods* which verifies that H4P2(2)(c) and (d) will be achieved.

11.3.7 Protection of openable windows – bedrooms

[2019: 3.9.2.6]

(1) A window opening in a bedroom must be provided with protection, where the floor below the window is 2 m or more above the surface beneath.

(2) Where the lowest level of the window opening covered by (1) is less than 1.7 m above the floor, the window opening must comply with the following:

   (a) The openable portion of the window must be protected with—

      (i) a device capable of restricting the window opening; or

      (ii) a screen with secure fittings.

   (b) A device or screen *required* by (a) must—

      (i) not permit a 125 mm sphere to pass through the window opening or screen; and

      (ii) resist an outward horizontal action of 250 N against the—

         (A) window restrained by a device; or

         (B) screen protecting the opening; and

      (iii) have a child resistant release mechanism if the screen or device is able to be removed, unlocked or overridden.

(3) Where a device or screen provided in accordance with (2)(a) is able to be removed, unlocked or overridden, a barrier with a height not less than 865 mm above the floor is *required* to an openable window in addition to window protection.

(4) A barrier covered by (3) must not—

   (a) permit a 125 mm sphere to pass through it; and

   (b) have any horizontal or near horizontal elements between 150 mm and 760 mm above the floor that facilitate climbing (see Figure 11.3.7).
Figure 11.3.7: Protection of openable windows — bedrooms

Explanatory Information: Intent
The intent of 11.3.7 is to reduce the risk of a person (especially a young child) falling through an openable window.

Explanatory Information: Protection of openable windows – bedrooms
Where the floor level below an openable window in a bedroom is less than 2 m there are no specific requirements. For an openable window 2 m or more above the surface beneath, openable windows are required to restrict passage of a 125 mm sphere using any one of the following design solutions:
(a) The window be designed such that any opening does not allow a 125 mm sphere to pass through (e.g. louvres) and be capable of resisting a 250 N force when directed against the window.
(b) The window be fitted with a fixed or dynamic device that is capable of restricting the window opening so it does not allow a 125 mm sphere to pass through and is difficult for a young child to operate. The restricting device must be capable of resisting a 250 N force when directed against the window such as a casement window or in attempting to push a sliding window open. An internal screen with similar parameters may be installed.
(c) The window be fitted with an internal or external screen that does not allow a 125 mm sphere to pass through and which must resist a horizontal outward force of 250 N.

If the openable part of the window is at least 1.7 m above the floor, no further protection is required.

Explanatory Information: Restricting devices
Where a device or screen is securely fixed in position (e.g. a screen pop riveted to the window frame) so it cannot be unlocked, overridden, or is very difficult to remove without for example a drill, the 865 mm barrier would not be required as the securing method is considered a fixture and not a child resistant release mechanism. 11.3.7(2)(b)(iii) relates to a screen or window restricting device protecting an openable window in a bedroom. The screen or opening restricting device may be installed in a manner that allows it to be removed, unlocked or overridden in the event of a fire or other emergency to allow safe egress. In these situations the unlocking device must be child resistant.

Child resistance could be achieved by the need to use a tool, key or two hands.

There are a number of hardware options available. Short chain winders and barrier screens will allow windows to comply with this requirement. Sliding window locks may lock a sash so a 125 mm sphere cannot pass through. Where provision is made to fully open the window beyond 125 mm then the child resistant release mechanism is required in addition to the device resisting a 250 N force as required by 11.3.7(2)(b)(ii).

11.3.7 in addition prescribes that an 865 mm barrier (sill) would be required. A wall beneath an openable window or fixed glazing under the openable part of a window which meets the height requirements (e.g. transom at least 865 mm
above the floor) can be considered as the barrier if the criteria in 11.3.7 are met.

Explanatory Information: Use of the term ‘window’
The term “window” is not italicised in 11.3.7 and as such, is not restricted to the definition of “window” in the NCC. The reason for this is to also capture windows that may let in air but not light, e.g. metal louvres. A metal louvre or openable panel would not fit in the NCC definition of window but is subject to the window barrier provisions.

11.3.8 Protection of openable windows – rooms other than bedrooms

(1) A window opening in a room other than a bedroom must be provided with protection where the floor below the window is 4 m or more above the surface beneath.

(2) The openable part of the window covered by (1) must be protected with a barrier with a height of not less than 865 mm above the floor.

(3) A barrier required by (2) must not—
   (a) permit a 125 mm sphere to pass through it; and
   (b) have any horizontal or near horizontal elements between 150 mm and 760 mm above the floor that facilitate climbing.

(4) See Figure 11.3.8.

Figure 11.3.8: Protection of openable windows — rooms other than bedrooms
Explanatory Information: Intent
The intent of 11.3.8 is to reduce the risk of a person (especially a young child) falling through an openable window.

Explanatory Information: Protection of openable windows – rooms other than bedrooms
A wall beneath an openable window or fixed glazing under the openable part of a window which meets the height requirements (e.g. transom at least 865 mm above the floor) can be considered as the barrier if the criteria in 11.3.8(2) are met.

Explanatory Information: Use of the term ‘window’
The term “window” is not italicised in 11.3.8 and as such, is not restricted to the definition of “window” in the NCC. The reason for this is to also capture windows that may let in air but not light, e.g. metal louvres. A metal louvre or openable panel would not fit in the NCC definition of window but is subject to the window barrier provisions.
12 Ancillary provisions

Part 12.1 Scope and application of Section 12
12.1.1 Scope
12.1.2 Application

Part 12.2 Construction in alpine areas
12.2.1 Application of Part 12.2
12.2.2 External doors
12.2.3 External trafficable structures
12.2.4 Clear spaces around buildings

Part 12.3 Attachment of framed decks and balconies to external walls
12.3.1 Application of Part 12.3
12.3.2 Fixing decks and balconies to external walls
12.3.3 Flashings to the junction of the waling plate and external wall
12.3.4 Bracing

Part 12.4 Boilers, pressure vessels, heating appliances, fireplaces, chimneys and flues
12.4.1 Application of Part 12.4
12.4.2 Open fireplace construction
12.4.3 Chimney construction
12.4.4 Installation of insert fireplaces and flues
12.4.5 Installation of free standing heating appliances
12.4.6 Installation of boilers and pressure vessels
Part 12.1  Scope and application of Section 12

12.1.1  Scope

(1) This Section of the ABCB Housing Provisions sets out the *Deemed-to-Satisfy Provisions* for—
   (a) construction in *alpine areas* (see Part 12.2); and
   (b) attachment of decks and balconies to external walls (see Part 12.3); and
   (c) *boilers, pressure vessels*, heating appliances, fire places, chimneys and flues (see Part 12.4).

(2) For other ancillary provisions and additional construction requirements not included in this Section of the ABCB Housing Provisions, refer to the following *Deemed-to-Satisfy Provisions* in NCC Volume Two:
   (a) *swimming pools* (see H7D2).
   (b) earthquake areas (see H1D9).
   (c) *flood hazard areas* (see H1D10).
   (d) construction in bushfire-prone areas (see H7D4).

12.1.2  Application

The application of Section 12 of the ABCB Housing Provisions is subject to the following:
   (a) The Governing Requirements of NCC 2022 Volume Two.
   (b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:

In NCC 2019, the content of Section 12 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Parts 3.10.4, 3.10.6 and 3.10.7 of NCC 2019 Volume Two.

In NCC 2019 Volume Two, Parts 3.10.1, 3.10.2, 3.10.3 and 3.10.5 did not include an acceptable construction practice.
Part 12.2  Construction in alpine areas

12.2.1  Application of Part 12.2

Part 12.2 applies subject to the provisions at H7D3(2) and (3).

Explanatory Information:
Buildings constructed in alpine areas need special consideration because of sub-zero temperatures which can create elements which restrict free movement to and from the building. The additional measures in this Part include—

- having external doorways open in a way that is not impeded by snow and ice outside; and
- for external trafficable structures forming part of the means of egress, being constructed so that they remain useable under snow conditions, and
- minimising the impact of snow build up between and around buildings.

Part 2.2 (structural provisions) and Section 13 (energy efficiency) also contain specific additional requirements for a building located in an alpine area.

12.2.2  External doors

External doors that may be subject to a build-up of snow must—

(a) open inwards or slide; and
(b) be constructed so that the threshold is not less than 900 mm above the adjoining surface; and
(c) in a Class 1b building, be marked “OPEN INWARDS” on the inside face of the door in letters not less than 75 mm high and in a colour contrasting with that of the background.

12.2.3  External trafficable structures

External stairways, ramps, access bridges or other trafficable structures serving the building must have—

(a) a floor surface that consists of expanded mesh if it is used as a means of egress; and
(b) any required barrier designed so that its sides are not less than 75% open; and
(c) for a stairway, goings (G), risers (R) and slope relationship quantity (2R + G) in accordance with—
   (i) Table 11.2.2a; or
   (ii) Table 12.2.3; and
(d) for a ramp serving an external doorway, a gradient not steeper than 1:12.

Table 12.2.3:  Alternative stair riser and going dimensions

</tbody>
</table>
12.2.4 Clear spaces around buildings

A building must be constructed so that—

(a) for any external walls more than 3.6 m above the natural ground level, the distance of that part of the building from the allotment boundary (other than a road alignment) must be not less than 2.5 m plus an additional 100 mm for each 300 mm or part by which that part of the external wall exceeds a height of 3.6 m (see Figure 12.2.4a); and

(b) if an external doorway discharges into a court between wings of a building and that area may be used for vehicle access to the building, the clear distance between wings must be not less than 4 m (see Figure 12.2.4b); and

(c) where an external doorway discharges opposite a feature that could trap snow or an embankment that is more than 900 mm above the threshold of that doorway, a minimum clear distance of not less than 4 m must be provided between the door and the feature (see Figure 12.2.4c and Figure 12.2.4d).

Figure 12.2.4a: Clear spaces around buildings — Set-back from allotment boundary where wall exceeds 3.6 m
Figure 12.2.4b: Clear spaces around buildings — External doorway discharging into a court between wings of a building

Figure 12.2.4c: Clear spaces around buildings — Embankments adjoining buildings

Figure 12.2.4d: Clear spaces around buildings — Use of a threshold where clear space is not available

Explanatory Information: Snow build-up around buildings

The design and construction of a building in an alpine area must not aid dangerous levels of snow build-up between and around buildings. This control—

- assists with egress in an emergency; and
- helps vehicle access around the buildings, both for snow clearing and emergency situations; and
- minimises the risk of snow or ice falling from the roof onto adjoining lots or egress routes.
### Explanatory Information: Set-back distances
12.2.4(a) prescribes set-back requirements for *external walls* from the boundary of adjoining allotments. The aim is to ensure that a reasonable distance is created between buildings to reduce the amount of snow build-up between properties. 12.2.4(a) applies only to the area adjacent to that part of the wall that is more than 3.6 m in height.

### Explanatory Information: Distance between wings of buildings
12.2.4(b) prescribes a minimum distance between wings of a building or attached buildings where external doorways may discharge into this area. This requirement only applies where the court or wings are able to be accessed by vehicles.

### Explanatory Information: Embankments adjoining buildings
12.2.4(c) applies where features adjacent to an external doorway could trap snow and complicate access and egress to and from the building.
12.3.1 Application of Part 12.3

Part 12.3 applies subject to the limitations set out at H1D11.

12.3.2 Fixing decks and balconies to external walls

Where a deck or balcony relies on the external wall of a building or structure for support, the method of attachment, including any fixings, to the external wall must comply with the following:

(a) The deck or balcony’s joist framing members must be supported at the wall by a waling plate.
(b) The joist span nearest the external wall must not be more than 3 m (single or continuous span).
(c) The size of a waling plate required by (a) must be not less than—
   (i) for a timber waling plate—190 x 45 mm with a minimum stress grade of F5 or MGP10; or
      (A) 140 x 35 mm with a minimum stress grade of F5 or MGP10 when fixed to concrete core-filled masonry using M12 bolts chemical or expanding/mechanical anchors; or
      (B) 90 x 35 mm with a minimum stress grade of F5 or MGP10 when fixed to timber frames using No. 14 partial threaded self-drilling screws; or
   (ii) for a steel waling plate — C15015 (minimum Grade G550) with the web located against the external wall.
(d) A waling plate must be attached so that—
   (i) for core-filled reinforced concrete masonry external walls, fixings are staggered along the waling plate at not more than 300 mm centres measured along the waling plate; and
   (ii) for timber external walls frames, two No. 14 Type screws fixings are provided—into a solid joist or bearer framing member that is not less than 190 x 100 mm with a minimum stress grade of F5 or MGP10, at not more than 300 mm centres measured along the waling plate; and
      (A) into a solid joist or bearer framing member that is not less than 90 x 45 mm with a minimum stress grade of F5 or MGP10; and
      (B) for deck construction— at not more than 450 mm centres measured along the waling plate; and
      (C) for tiled balcony construction— at not more than 400 mm centres measured along the waling plate; and
   (iii) for steel framed external walls, two fixings are provided into a joist or bearer framing member not less than C20015 (Grade G550) at not more than 300 mm centres measured along the waling plate; and
   (iv) fixings are—installed within 300 mm of each end of the waling plate, and in accordance with the following (as applicable):
      (A) installed within 300 mm of each end of the waling plate; and
      (B) for a timber waling plate — deck construction; two No. 14 partial threaded self-drilling screws at not more than 450 mm centres and not located within 65 mm from the ends or within 30 mm from the top and bottom edges; or not located within 120 mm from the ends or within 60 mm from the top and bottom edges; and
      (C) for a timber waling plate — deck construction; M12 bolts chemical or expanding/mechanical anchors at not more than 400 mm centres and not located within 120 mm from the ends or within 60 mm from the top and bottom edges.
      (D) for a timber waling plate — tiled balcony construction; two No. 14 partial threaded self-drilling screws at not more than 400 mm centres and not located within 65 mm from the ends or within 30 mm from the top and bottom edges.
For a timber waling plate — tiled balcony construction: M12 bolts chemical or expanding/mechanical anchors at not more than 300 mm centres and not located within 120 mm from the ends or within 60 mm from the top and bottom edges.

For a steel waling plate — not located within 50 mm from the ends or within 30 mm from the top and bottom edges.

(e) Fixings for attaching a waling plate to an external wall must be—

(i) for timber external wall frames with a minimum stress grade of F5 or MGP 10, No. 14 partial threaded self-drilling screws so that each screw is embedded not less than 44 mm into the joist or bearer member (see Figure 12.3.2a); and—

(A) M12 coach screws with not less than 3 mm thick 55 mm diameter washers fixed so that the coach screw is embedded not less than 96 mm into the joist or bearer framing member (see Figure 12.3.2a); or

(B) 4.6/S M12 bolts with not less than 3 mm thick 55 mm diameter washers placed on the waling plate under the bolt head; and

(ii) for steel external wall frames, 8.8/S M12 bolts with not less than 3 mm thick 55 mm diameter washers; and

(iii) for a core-filled masonry external wall, 4.6/S M12 chemical or expanding/mechanical anchors with—

(A) a minimum 2 kN working load capacity in shear and 1.5 kN in tension; and

(B) not less than 3 mm thick 55 mm diameter washers placed on the waling plate under the anchor head (see Figure 12.3.2b).

(f) Fixings used for attaching waling plates to external walls must be—

(i) stainless steel where the building is located within 200 m of breaking surf; or

(ii) hot-dipped galvanised, stainless steel or monel metal for all other areas.

Figure 12.3.2a: Methods of attachment — M12 coach screws, No. 14 partial threaded self-drilling screws into a timber framed external wall.
Figure 12.3.2b: Methods of attachment - 4.6/S M12 chemical or masonry anchors into a core-filled reinforced masonry external wall

Explanatory Information:

When using fixings 12.3.2(1)(d), care must be taken if chemical anchors are selected. The use of chemical anchors in horizontal applications is limited. Attention should be paid to selecting only chemical anchors that are specifically designed and manufactured for use in horizontal or overhead applications.

Consideration needs to be given to offsetting the waling plate fastener spacing to avoid interference with joist attachment. To ensure fasteners are positively anchored to the building or structure they need to be located so that they are not fixed into mortar beds between masonry units or fixed into blocking or the end grains of timbers.

An I-beam is not considered a solid joist or bearer framing member under 12.3.2(d)(ii) and is therefore not permitted as an appropriate method of support for attachment of a deck or balcony to an external wall.

The working load capacity of an anchor required by 12.3.2(e)(iii)(A) may be available in technical data provided by the manufacturer of the anchor.

The bolt category 4.6/S refers to a commercial bolt of a strength grade of 4.6 using a snug tight method of tensioning. AS 4100 contains information on tensioning techniques and the methods of determining the strength of an anchor.

Where the waling plate is fixed to the external wall through wall cladding, fixing length must be increased to compensate for the additional width of the cladding to ensure the connection to the external wall is structurally adequate.

All coach screwed joints should be pre-drilled with a pilot hole whose diameter is not greater than that of the threaded portion of the screw.

12.3.3 Flashings to the junction of the waling plate and external wall

Where the wall cladding is removed to attach a waling plate, openings in external wall cladding exposed to the weather...
must be flashed with materials complying with AS/NZS 2904 and in accordance with the following:

(a) **Flashings** must be provided to bottom, tops and the sides of the junction of the waling plate and the external wall, and must be installed so that the flashing—
    (i) extends not less than 150 mm beyond each side of the waling plate where practicable; and
    (ii) is attached to the waling plate and wall framing; and
    (iii) at the top and bottom of the waling plate, drains to the outside face of the wall or cladding.

(b) Joins in the flashing must—
    (i) overlap by not less than 75 mm in the direction of flow; and
    (ii) be securely fastened at intervals of not more than 40 mm; and
    (iii) have sealant installed between laps.

(c) The method of flashing must be suitable for the framing and cladding used.

(d) **Flashings** must be securely fixed at least 25 mm under the cladding at ends and edges of the framing of the opening.

**Explanatory Information:**

Consideration needs to be given to the method of fixing the waling plate to the external wall so that deterioration of the external wall as a result of water entry will not occur. Such cases would include where the wall cladding is removed to attach a waling plate. This may be achieved by installing flashing between the external wall and the waling plate.

### 12.3.4 Bracing [2019: 3.10.6.4]

Where a deck or balcony is more than 1 m off the ground when measured from the upper most surface of the deck or balcony at any point to the top of any supporting footing, bracing must be installed as follows:

(a) Two diagonally opposed 30 x 0.8 mm galvanized steel straps must be installed across the top or underside of the joists and be attached using one fixing at—
    (i) each joist or equivalent framing member; and
    (ii) the waling plate.

(b) A secondary set of 30 x 0.8 mm steel straps must be installed using one fixing at each joist or equivalent framing member in accordance with Figure 12.3.4 where the deck or balcony extends more than 4 m from the external wall.

(c) The steel straps must—
    (i) be continuous and extend diagonally at an angle between 30° to 60°; and
    (ii) span not more than 4 m when measured along a line at a right angle from the external wall.

(d) Fixings for the steel straps must be—
    (i) for timber framing, 50 x 3.15 hot-dipped galvanized flat head ring shank or flat head deformed nail; or
    (ii) for steel framing, 8-18 self embedding head or wafer head screws.

(e) Where the deck or balcony is located within a severe corrosion environment the bracing and fixings must comply with Table 6.3.4, Table 6.3.9a, 6.3.9b and 6.3.9c.
Figure 12.3.4: Bracing of decks and balconies

a) Decks or balconies extending up to 4 m from the external wall

b) Decks or balconies extending more than 4 m from the external wall
12.4.1 Application of Part 12.4

[New for 2022]]

For the installation of a domestic solid fuel burning appliance, Part 12.4 need not be complied with if H7D5(a) is complied with.

12.4.2 Open fireplace construction

[2019: 3.10.7.2]

An open fireplace, or solid-fuel burning appliance in which the fuel-burning compartment is not enclosed must have—

(a) all masonry constructed in accordance with H1D5; and
(b) a hearth constructed of stone, concrete, masonry or similar non-combustible material so that—
   (i) it extends not less than 300 mm beyond the front of the fireplace opening and not less than 150 mm beyond each side of that opening; and
   (ii) its upper surface does not slope away from the back hearth (see Figure 12.4.2(b)); and
   (iii) combustible material, such as flooring or framing members below or around the external edge of the hearth, is situated not less than 150 mm from the upper surface of the hearth (see Figure 12.4.2); and
(c) walls forming the sides and back of the fireplace up to a height of 300 mm above the underside of the arch or lintel which—
   (i) are constructed in 2 separate leaves of solid masonry with a total combined thickness not less than 180 mm thick, excluding any cavity; and
   (ii) do not consist of concrete block masonry in the construction of the inner leaf; and
   (iii) are constructed of masonry units with a net volume, excluding cored and similar holes, not less than 75% of their gross volume, measured on the overall rectangular shape of the units, and with an actual thickness of not less than 100 mm; and
(d) the fireplace must be constructed on footings complying with 4.2.18.
Figure 12.4.2: Fireplace clearance from combustible materials

The construction of a chimney must comply with H1D5 and the following:

(a) The walls of the chimney above the level referred to in 12.4.2(c) must be lined internally to a thickness of not less than 10 mm with composition mortar parging.

(b) The composition mortar in (a) must comply with AS 3700 or AS 4773 except that the mortar must be mixed by volume in the proportions of 1 part cement : 1 part lime : 5 parts sand.

(c) The chimney or flue must terminate not less than 300 mm above the highest part of the building within a horizontal distance of 3.6 m of the chimney or flue (see Figure 12.4.3).
12.4.3
Explanatory Information:
1. The requirements of this Part are to be read in conjunction with the building sealing requirements in Part 13.4. However, it should be noted that Part 13.4 does not apply in all States and Territories.
2. 12.4.3(a) requires the internal faces of masonry chimneys to be parged with a mortar to protect masonry elements and mortar beds from the corrosive by-products of combustion.

12.4.4 Installation of insert fireplaces and flues
[2019: 3.10.7.4]
An insert fireplace and flue must comply with the following:
(a) The insert fireplace and flue must be tested and passed the tests required by AS/NZS 2918.
   (i)  tested and passed the tests required by AS/NZS 2918; and
   (ii) fitted into a masonry fireplace (including chimney) constructed in accordance with H1D5 and Figure 12.4.4.
(b) The insert fireplace must be fitted into a masonry fireplace (including chimney) constructed in accordance with H1D5.
(c) The flue must be double skin and have been tested and pass the tests required by AS/NZS 2918.
(d) There must be a clearance of 50 mm between the outer flue and adjacent materials.
(e) The flue must terminate in accordance with Figure 12.4.3.
(f) The hearth must be constructed in accordance with 12.4.2(b) and (d).
The installation of a free standing heating appliance must comply with the following:

(a) The appliance must—
   (i) be installed with safety clearances determined by testing in accordance with AS/NZS 2918; or
   (ii) be located not less than 1.2 m from adjoining walls (other than a masonry wall); or
   (iii) have a heat shield between the adjoining wall (other than a masonry wall) and the heating appliance in accordance with Figure 12.4.5a and Figure 12.4.5b.

(b) Where a heat shield is used, it must be installed in accordance with Figure 12.4.5a and Figure 12.4.5b, and it must be not less than 90 mm thick masonry constructed in accordance with H1D5, and—
   (i) have an FRL of 60/60/60; or
   (ii) be not less than 90 mm thick masonry constructed in accordance with H1D5.

(c) The heating appliance must be installed on a hearth—
(i) complying with 12.4.2(b), except that the hearth must extend 400 mm from the front and sides of the appliance in accordance with Figure 12.4.5a and Figure 12.4.5b; or

(ii) where a heat shield is installed, in accordance with Figure 12.4.5a and Figure 12.4.5b.

(d) The flue must—

(i) have been tested and passed the tests required by AS/NZS 2918; and

(ii) be installed in accordance with Figure 12.4.5c; and

(iii) terminate in accordance with Figure 12.4.3; and,

(iv) be flashed in accordance with H1D7.

(e) Flue types or installation of flues in areas not specifically covered by Figure 12.4.5a and Figure 12.4.5b and Figure 12.4.5c must be installed in accordance with AS/NZS 2918.

Figure 12.4.5a: Acceptable location of free standing heating appliances — Elevation

[Image of figure 12.4.5a showing the clearance and location of heating appliances and flues with relevant dimensions and labels.]
Figure 12.4.5b: Acceptable location of free standing heating appliances — Plan view

- **Non masonry wall**
- **Heating appliance**

25 mm clearance between heat shield and wall
50 mm clearance between heat shield and appliance
90 mm min. masonry heat shield
Figure 12.4.5c: Acceptable flue installation details

Figure Notes:
Flue pipe size — 150 mm maximum (for other sizes see AS/NZS 2918).

Explanatory Information:
References to AS/NZS 2918 in 12.4.5(a)(i) and (d)(i) is only applicable in the context in which it is referred to in accordance with A4G1(2). 12.4.5(a) provides three options for the installation of free standing heating appliances. Where 12.4.5(a)(i) is chosen as a solution the free standing heating appliance must be installed with safety clearances determined by testing in accordance with AS/NZS 2918. 12.4.5(d)(i), in addition to (d)(ii) and (d)(iii), require the flue to be tested and have passed the tests required by AS/NZS 2918.
12.4.6  **Installation of boilers and pressure vessels**

The installation of a boiler or pressure vessel heating appliance within a building, must comply with the following:

(a) The distance between the vent of any explosion relief device and any adjacent wall, roof, ceiling or other solid construction must be calculated in accordance with Table 12.4.6.

(b) Floor surfaces beneath a *boiler* or *pressure vessel* must be water resistant and formed to drain away from supports and structural building elements.

(c) Where a safe tray is provided to trap liquids, it must be manufactured from a material resistant to corrosion from the contents of the *boiler* or *pressure vessel*.

(d) Building elements surrounding a *boiler* must be protected from any furnace heat by refractory material or effective air spaces so that:
   (i) steel elements do not exceed a temperature of more than 300°C; and
   (ii) concrete elements do not exceed a temperature of more than 200°C; and
   (iii) timber elements do not exceed a temperature of more than 150°C.

**Table 12.4.6:**  
**Minimum clearances for explosion relief**

<table>
<thead>
<tr>
<th>Clearance from</th>
<th>Minimum clearance (metres)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjacent wall or ceiling/roof</td>
<td>0.4(V/3)¹⁄³ or 0.4 m, whichever is the greater</td>
</tr>
<tr>
<td>Two walls at right angles; or one wall and a ceiling/roof</td>
<td>0.6(V/3)¹⁄³ or 0.6 m, whichever is the greater</td>
</tr>
</tbody>
</table>

**Table Notes:**

V is the internal volume of the boiler or pressure vessel being vented, up to the connection of the flue.

**Explanatory Information:**

The requirements of 12.4.6 are limited to a *boiler* or *pressure vessel* heating appliance within a building. Therefore, the provision does not apply to a *boiler* or *pressure vessel* outside of these limitations, such as a portable gas appliance.

Table 12.4.6 provides the minimum clearance required which is based on the volume of the space being vented. The minimum clearance is determined by a formula which includes the volume of the space being vented.

The intention of the explosion relief provisions is that, in the event of an explosion, the extent of damage is limited. The minimum clearance determined in the first row is 0.4 m from an adjacent wall or ceiling/roof.

The minimum clearance determined in the second row is 0.6 m from two walls at right angles, or one wall and a ceiling/roof. This scenario poses a higher risk of damage from over pressure experienced during a deflagration and therefore both the ventilation and clearances are increased.

13.6.9 Spa pool heating and pumping
Part 13.1 Scope and application of Section 13

NSW Part 13.1
NT Part 13.1

13.1.1 Scope

This Section of the ABCB Housing Provisions sets out the Deemed-to-Satisfy Provisions for energy efficiency:

(a) Building fabric (see Part 13.2).
(b) External glazing (see Part 13.3).
(c) Building sealing (see Part 13.4).
(d) Air movement (see Part 13.5).
(e) Services (see Part 13.6).

13.1.2 Application

The application of Section 13 of the ABCB Housing Provisions is subject to the following:

(a) The Governing Requirements of NCC 2022 Volume Two.
(b) The State and Territory variations, additions and deletions contained in the Schedules to the ABCB Housing Provisions and NCC Volume Two.

Explanatory Information:

In NCC 2019, the content of Section 13 of the ABCB Housing Provisions (other than content added in NCC 2022 or later) was contained in the acceptable construction practices for Part 3.12 of NCC 2019 Volume Two.
13.2.1 Application of Part 13.2

[2019: 3.12.1]

(1) The provisions of 13.2.2 to 13.2.6 apply to—
   (a) a Class 1 building; and
   (b) a Class 10a building with a conditioned space.

(2) The provisions of 13.2.7 apply to a Class 1 building with an attached Class 10a building.

(3) Part 13.2 must be applied as directed in H6D2(1)(a) or (b).

13.2.2 Building fabric thermal insulation

[2019: 3.12.1.1]

(1) Where required, insulation must comply with AS/NZS 4859.1 and be installed so that it—
   (a) buts or overlaps adjoining insulation other than at supporting members such as columns, studs, noggings, joists, furring channels and the like where the insulation must butt against the member; and
   (b) forms a continuous barrier with ceilings, walls, bulkheads, floors or the like that inherently contribute to the thermal barrier; and
   (c) does not affect the safe or effective operation of a domestic service or fitting.

(2) Where required, reflective insulation must be installed with—
   (a) the necessary airspace, to achieve the required $R$-Value between a reflective side of the reflective insulation and a building lining or cladding; and
   (b) the reflective insulation closely fitted against any penetration, door or window opening; and
   (c) the reflective insulation adequately supported by framing members; and
   (d) each adjoining sheet of roll membrane being—
      (i) overlapped greater than or equal to 150 mm; or
      (ii) taped together.

(3) Where required, bulk insulation must be installed so that—
   (a) it maintains its position and thickness, other than where it crosses roof battens, water pipes, electrical cabling or the like; and
   (b) in a ceiling, where there is no bulk insulation or reflective insulation in the external wall beneath, it overlaps the external wall by greater than or equal to 50 mm.

Explanatory Information: Example

1. For example, in a two storey house with the second storey set back, the insulation in the first storey wall, the second storey wall and the roof over the set-back must be continuous. Therefore if the roof over the set-back has insulation on a horizontal ceiling, then insulation is also needed on the vertical in any ceiling space in order to connect the ceiling insulation to the second storey wall.

2. To form a continuous barrier, insulation should be placed in gaps between window and door jambs, heads and sills, and the adjoining wall framing unless a gap is otherwise required. This may need to be compressible to allow for movement between members.

Explanatory Information: Safety of domestic services

Care should be taken when installing insulation to ensure that it does not interfere with the safety or performance of
domestic services and fittings such as heating flues, recessed light fittings, light transformers, gas appliances and general plumbing and electrical components. This includes providing appropriate clearance as detailed in relevant legislation and referenced standards such as for electrical, gas and fuel oil installations.

Explanatory Information: Airspace adjoining reflective insulation
For reflective insulation and the adjoining airspace to achieve its tested R-Value, the airspace needs to be a certain width. This width varies depending on the particular type of reflective insulation and the R-Value to be achieved.

Explanatory Information: Adjoining sheets of roll membrane
Where reflective insulation also acts as a vapour barrier or sarking, both the minimum overlap and taping may be necessary.

Explanatory Information: Compression of bulk insulation
The R-Value of bulk insulation is reduced if it is compressed. The allocated space for bulk insulation must therefore allow the insulation to be installed so that it maintains its correct thickness when using the product's stated R-Value, otherwise the R-Value needs to be reduced to account for any compression. This is particularly relevant to wall and cathedral ceiling framing whose members can only accommodate a limited thickness of insulation. In some instances, larger framing members or thinner insulation material, such as polystyrene boards, may be necessary to ensure that the insulation achieves its required R-Value.

Explanatory Information: Airspaces
The R-Value of reflective insulation and its adjoining airspace is affected by the width of the airspace between a reflective side of the reflective insulation and the building lining or cladding. For further information on reflective insulation, refer to the explanatory information accompanying 13.2.2.

Explanatory Information: Condensation
Artificial cooling of buildings in some climates can cause condensation to form inside the layers of the building envelope. Such condensation can cause significant structural or cosmetic damage to the envelope before it is detected. Associated mould growth may also create health risks to the occupants. Effective control of condensation is a complex issue. In some locations a fully sealed vapour barrier may need to be installed on the more humid, or generally warmer, side of the insulation. Note that Part 10.8 contains specific provisions for condensation.

13.2.3 Roofs

(1) Subject to (2) and (5), a roof must—
(a) achieve the specified in Tables 13.2.3a to 13.2.3g as appropriate, for the direction of heat flow; and
(b) where a pitched roof has a flat ceiling, have greater than or equal to 50% of the added insulation laid on the ceiling.

(2) In Climate zones 1, 2, 3, 4 and 5 the specified in Tables 13.2.3a to 13.2.3g as appropriate, is reduced by 0.5 where—
(a) the required insulation is laid on the ceiling; and
(b) the roof space is ventilated by—
(i) gable vents, ridge vents, eave vents, roof vents or the like that—
(A) are evenly distributed to allow an unobstructed flow of air; and
(B) are located to ensure, where practicable, there are no dead airspaces; and
(C) have an aggregate fixed open area of greater than or equal to 1% of the ceiling area; or
(ii) having—
(A) not less than 2 wind-driven roof ventilators having an aggregate opening area of greater than or equal to 0.14 m$^2$; and
(B) gable vents, ridge vents, eave vents, roof vents or the like that have an aggregate fixed open area of greater than or equal to 0.2% of the ceiling area.

(3) A roof that—
(a) is required to achieve a minimum; and
(b) has metal sheet roofing directly fixed to metal purlins, metal rafters or metal battens; and
(c) does not have a ceiling lining or has a ceiling lining fixed directly to those metal purlins, metal rafters or metal battens,

must have a thermal break, consisting of a material with an \textit{R-Value} of greater than or equal to 0.2, installed between the metal sheet roofing and its supporting metal purlins, metal rafters, or metal battens.

(4) A roof, or roof and associated ceiling, is deemed to have the following:
(a) For a flat roof, skillion roof and cathedral ceiling with a ceiling lining under the rafter, unventilated and constructed as shown in Figure 13.2.3a:
   (i) Downwards direction of heat flow: $= 0.48$
   (ii) Upwards direction of heat flow: $= 0.36$.
(b) For a flat roof, skillion roof and cathedral ceiling with exposed rafters, unventilated and constructed as shown in Figure 13.2.3b:
   (i) Downwards direction of heat flow: $= 0.44$.
   (ii) Upwards direction of heat flow: $= 0.38$.
(c) For a tiled pitched roof with flat ceiling constructed as shown in Figure 13.2.3c:
   (i) Ventilated roof space:
      (A) Downwards direction of heat flow: $= 0.74$.
      (B) Downwards direction of heat flow: $= 0.23$.
   (ii) Unventilated roof space:
      (A) Downwards direction of heat flow: $= 0.56$.
      (B) Downwards direction of heat flow: $= 0.41$.
(d) For a metal pitched roof with flat ceiling constructed as shown in Figure 13.2.3d:
   (i) Ventilated roof space:
      (A) Downwards direction of heat flow: $= 0.72$.
      (B) Downwards direction of heat flow: $= 0.21$.
   (ii) Unventilated roof space:
      (A) Downwards direction of heat flow: $= 0.54$.
      (B) Downwards direction of heat flow: $= 0.39$.

(5) For the purposes of (4)(a) to (d):
(a) The \textit{R-Value} of the roof and ceiling construction shown in Figures 13.2.3a to 13.2.3d is based there being a roof space.
(b) If the roof space is filled, the roof space \textit{R-Value} needs to be subtracted from the \textit{R-Value} of the roof and ceiling materials.
(c) The \textit{R-Value} of the unventilated roof and ceiling construction in Figure 13.2.3c for tiled roofs is based on there being a \textit{sarking-type material} which would prevent ventilation of the roof space through gaps in the roof tiles.

(6) Where, for operational or safety reasons associated with exhaust fans, flues or recessed downlights, the area of required ceiling insulation is reduced, the loss of insulation must be compensated for by increasing the \textit{R-Value} of insulation in the remainder of the ceiling in accordance with Table 13.2.3h.

(7) Where the minimum \textit{R-Value} of ceiling insulation required to satisfy (1) is not stated in Table 13.2.3h, interpolation may be used to determine the adjusted minimum \textit{R-Value}.

2. Where the minimum *R-Value* of ceiling insulation required to satisfy 13.2.3(1) is greater than or equal to 6.0, adjustment to compensate for loss of ceiling insulation area is not permitted.
Figure 13.2.3a: Flat roof, skillion roof and cathedral ceiling with a ceiling lining under the rafter

Figure Notes:
1. The Total R-Value of the roof and ceiling construction in Figure 13.2.3a is based on there being a roof space.
2. If the roof space is filled, the roof space R-Value needs to be subtracted from the Total R-Value of the roof and ceiling materials.
Figure 13.2.3b: Flat roof, skillion roof and cathedral ceiling with exposed rafters

Figure Notes:
1. The *Total R-Value* of the roof and ceiling construction in Figure 13.2.3b is based on there being a roof space.
2. If the roof space is filled, the roof space *R-Value* needs to be subtracted from the *Total R-Value* of the roof and ceiling materials.
Figure 13.2.3c: Tiled pitched roof with flat ceiling

Figure Notes:

1. The Total R-Value of the roof and ceiling construction in Figure 13.2.3c is based on there being a roof space.

2. If the roof space is filled, the roof space R-Value needs to be subtracted from the Total R-Value of the roof and ceiling materials.

3. The Total R-Value of the unventilated roof and ceiling construction in Figure 13.2.3c for tiled roofs are based on there being sarking-type material which would prevent ventilation of the roof space through the gaps in the roof tiles.
Figure 13.2.3d: Metal pitched roof with flat ceiling

Figure Notes:
1. The Total R-Value of the roof and ceiling construction in Figure 13.2.3d is based on there being a roof space.
2. If the roof space is filled, the roof space R-Value needs to be subtracted from the Total R-Value of the roof and ceiling materials.

Explanatory Information: Tables 13.2.3a to 13.2.3g

1. The term ‘as appropriate’ used in reference to Tables 13.2.3a to 13.2.3g, means the table used must be appropriate to the climate zone in which the building is to be located.
2. The roof space ventilation option, in climate zones 1, 2, 3, 4 and 5, applies to a pitched roof with a flat ceiling to ensure that efficient cross ventilation is achieved in the roof space to remove hot air. Roof space ventilation is generally not suitable for most flat, skillion, cathedral ceiling and similar roof types because of the lack of space between the ceiling and roof.
3. Care should be taken to ensure that the roof ventilation openings do not allow rain penetration and that they comply with appropriate bushfire provisions.
4. Gaps between roof tiles with sarking (or reflective insulation at rafter level) and metal sheet roofing are not acceptable methods of providing roof space ventilation.
5. Compliance with the ventilation provisions in 13.2.3(2)(b) may result in the ingress of wind driven rain, fine dust, corrosive aerosols, or stimulate the growth of mould or fungus in the roof enclosure. Consideration should therefore be given to the surrounding environmental features, including exposure to marine or industrial environments, prior to adopting this as an alternative to the roof insulation provisions in 13.2.3(2)(b)(ii).
6. A low solar absorptance roof reduces the flow of heat from solar radiation better than a high solar absorptance roof. A roof with a solar absorptance value of less than 0.4 typically corresponds to a roof of light colour such as white, off-white or cream. Typical absorptance values based on ASTM E903 are shown in explanatory Table 13.2.3a below.
7. The direction of heat flow in Tables 13.2.3a to 13.2.3g, as appropriate, is considered to be the predominant direction of heat flow for the hours of occupation of the building. It takes into account the higher rate of occupancy of houses at night time rather than day time.
The weight of roof or ceiling insulation, particularly if additional ceiling insulation is used for compliance with the energy efficiency provisions, needs to be considered in the selection of plasterboard, plasterboard fixings and building framing.

</table>

Explanatory Information: Typical construction

1. Figures 13.2.3a to 13.2.3d provide examples of various roof and ceiling construction. The \( R\)-Value of the required insulation is calculated by subtracting the inherent Total \( R\)-Value of the roof and ceiling construction from the Total \( R\)-Value in Tables 13.2.3a to 13.2.3g. The inherent Total \( R\)-Value of the typical roof and ceiling has been determined by adding together the \( R\)-Values of the outdoor air film, roof cladding, roof airspace, ceiling sheet lining and internal film.

2. The Total \( R\)-Value of the roof and ceiling materials may need to be adjusted if other building elements such as sarking are also installed. For example, sarking or sheet insulation under tiles may change a roof space from “ventilated” to “unventilated”.

Explanatory Information: Thermal bridging

Irrespective of the framing material used, the minimum added \( R\)-Value specified in Figures 13.2.3a to 13.2.3d, Figures 13.2.5b to 13.2.5i and Table 13.2.6a is deemed to include the effect of thermal bridging created by framing members in situations other than described in the explanatory information regarding thermal breaks.

Explanatory Information: Thermal break

Because of the high thermal conductance of metal, a thermal break is to be provided where the ceiling lining of a house is fixed directly to the underside of the metal purlins or metal battens of a metal deck roof or where there is no ceiling lining. The purpose of the thermal break is to ensure that the thermal performance of this form of roof construction is comparable to that of a similar roof with timber purlins or timber battens.

A thermal break may be provided by materials such as timber, expanded polystyrene strips, plywood or compressed bulk insulation. The material used as a thermal break must separate the metal purlins or metal battens from the metal deck roofing and achieve the specified \( R\)-Value. Reflective insulation alone is not suitable for use as a thermal break because it requires an adjoining airspace to achieve the specified \( R\)-Value (see explanatory information regarding choice of insulation).

For the purposes of 13.2.3(3), expanded polystyrene strips of not less than 12 mm thickness, compressed bulk insulation, and timber of not less than 20 mm thickness are considered to achieve an \( R\)-Value of not less than 0.2.

Explanatory Information: Location of insulation

The thermal performance of the roof may vary depending on the position of the insulation, the climatic conditions, the design of the house and the way in which it is operated. For example, insulation installed under the roof, rather than on the ceiling, of a conditioned house with a large roof space is less effective because of the additional volume of roof airspace that would need to be heated or cooled. Conversely, for an unconditioned house, the use of reflective insulation is more effective when placed directly under the roof.
Explanatory Information: Choice of insulation

There are a number of different insulation products that may be used to achieve the minimum added *R-Value*. However, care should be taken to ensure that the choice made is appropriate for the construction and climatic conditions as the location and relationship between options in Figures 13.2.3a to 13.2.3d, Figures 13.2.5b to 13.2.5i and Table 13.2.6a may not be suitable in all circumstances for both practical and technical reasons. For instance, in some *climate zones*, insulation should be installed with due consideration of *condensation* and associated interaction with adjoining building materials. As an example, *reflective insulation* or sarking installed on the cold side of the building *envelope* should be vapour permeable. Note that Part 10.8 contains specific provisions for *condensation*.

*Reflective insulation* is considered to provide the following additional *R-Values* when used in conjunction with the *Total R-Value* of a pitched roof and flat ceiling construction described in Figures 13.2.3a to 13.2.3d. To achieve these values, the *reflective insulation* must be laid directly under the roof cladding and have a minimum airspace of 15 mm between a reflective side of the *reflective insulation* and the adjoining lining or roof cladding (see 13.2.2(2)).

The actual *R-Value* added by *reflective insulation* and its adjoining airspace should be determined for each product in accordance with relevant standards, taking into consideration factors such as the number of adjacent airspaces, dimensions of the adjacent airspace, whether the space is ventilated and the presence of an anti-glare coating. When *reflective insulation* has an anti-glare coating on one side, the emittance value of that side will be greater than the value of the uncoated side. See explanatory Tables 13.2.3b to 13.2.3d

Also, where another emittance value for *reflective insulation* is used (other than the value used in the table below), care should be taken to ensure that the number of airspaces allowed for is consistent with the form of construction and whether the airspace is reflective, partially reflective or non-reflective. Where bulk insulation fills the airspace, the *Total R-Value* should be reduced to take account of the loss of airspace.

Table Notes:
The **required** direction of heat flow applicable in each of the **climate zones** specified in Tables 13.2.3a to 13.2.3g.

Explanatory Information: Table 13.2.3h

1. When considering the reduction of insulation because of exhaust fans, flues or recessed downlights, 0.5% of the ceiling area for a 200 m² house would permit 2 bathroom heater-light assemblies, a laundry exhaust fan, a kitchen exhaust fan and either approximately 20 recessed down-lights with 50 mm clearance to insulation, 10 recessed downlights with 100 mm clearance to insulation or only 3 recessed downlights with 200 mm clearance to insulation.

2. Note that Table 13.2.3h refers to the R-Value of the insulation located on the ceiling and not the **Total R-Value** required of the roof. The roof has an inherent R-Value and there may also be insulation at the roof line.

3. Note that 13.2.3(6) does not require an increase in ceiling insulation for **roof lights**.

4. Placing some of the **required** insulation at the roof level may result in a more practical outcome. Insulation at the roof level is effective in warm climates and significantly moderates the roof space extremes and **condensation** risk in cold climates. Note that **Part 10.8** contains specific provisions for **condensation**.

13.2.4 Roof lights

[2019: 3.12.1.3]

1. **Roof lights** (including any associated shaft and diffuser) serving a habitable room or an interconnecting space such as a corridor, hallway, stairway or the like must —
   (a) if the **roof lights** are not **required** for compliance with H4D5 or —
      (i) comply with Table 13.2.4; and
      (ii) have an aggregate area of not more than 3% of the total **floor area** of the storey served; or
   (b) if the **roof lights** are **required** for compliance with H4D5 or H4D6—
      (i) have an area not more than 150% of the minimum area **required** by H4D6; and
      (ii) have transparent and translucent elements, including any imperforate ceiling diffuser with—
         (A) a **a** of not more than 0.29; and
         (B) a **a** of not more than 2.9.

2. For the purposes of Table 13.2.4, the following applies:
   (a) The **roof light** shaft index is determined by measuring the distance from the centre of the shaft at the roof to the centre of the shaft at the ceiling level and dividing it by the average internal dimension of the shaft opening at the ceiling level (or the diameter for a circular shaft) in the same units of measurement.
   (b) The **roof light** area index is the total area of **roof lights** serving the room or space as a percentage of the **floor area** of the room or space.
   (c) The total area of **roof lights** is the combined area for all roof lights serving the room or space.
   (d) The area of a **roof light** is the area of the roof opening that allows light to enter the building.
   (e) The thermal performance of an imperforate ceiling diffuser may be included in the **roof light**.

3. The total area of roof lights serving the room or space as a percentage of the **floor area** of the room or space must not be more than 5% unless allowed by (1)(b).

Explanatory Information:
1. The and are expressed as Australian Fenestration Rating Council (AFRC) values.
2. The and are for a roof light with or without a ceiling diffuser. A roof light may achieve the required performance on its own or in conjunction with a ceiling diffuser.
3. The and for some simple types of roof lights are shown in the tables below. Lower U-Value figures represent higher thermal resistance. Lower SHGC figures represent less solar heat transmission. The table gives worst case assessments, which can be improved by obtaining generic or custom product assessments from suppliers, manufacturers, industry associations (including their online resources) and from competent assessors.

### 13.2.5 External walls

(1) Each part of an external wall must satisfy the requirements of —

(a) (2) for all walls; or

(b) (3) for walls with a surface density greater than or equal to 220 kg/m², except for—

(i) opaque non-glazed openings such as doors (including garage doors), vents, penetrations, shutters and the like; and

(ii) unless covered by (3).

(2) Each part of an external wall must—

(a) in climate zones 1, 2, 3, 4 and 5—

(i) achieve a minimum of 2.8; or

(ii) achieve a minimum of 2.4 and shade the external wall of the storey with a verandah, balcony, eaves, carport or the like, which projects at a minimum angle of 15 degrees in accordance with Figure 13.2.5a; or

(b) in climate zones 6 and 7, achieve a minimum of 2.8; or

(c) in climate zone 8, achieve a minimum of 3.8.

(3) Each part of an external wall with a wall surface density of greater than or equal to 220 kg/m² must—

(a) in climate zones 1, 2 and 3—

(i) for a storey, other than one with a storey above, shade the wall with a verandah, balcony, eaves, carport or the like that projects at a minimum angle of 15 degrees in accordance with Figure 13.2.5a; and

(ii) when the external walls are not shaded in accordance with (i) and there is another storey above, external glazing complies with 13.3.2 with the applicable value for $C_{SHGC}$ in Tables 13.3.2a to 13.3.2c reduced by 20%; and

(iii) incorporate insulation with an R-Value of greater than or equal to 0.5; and

(iv) on the lowest storey containing habitable rooms, have either—

(A) a concrete slab-on-ground floor; or

(B) masonry internal walls; or

(b) in climate zone 5 (option a)—

(i) for a storey, other than one with a storey above, shade the wall with a verandah, balcony, eaves, carport or the like that projects at a minimum angle of 15 degrees in accordance with Figure 13.2.5a; and

(ii) when the external walls are not shaded in accordance with (i) and there is another storey above, external glazing complies with 13.3.2 with the applicable value for $C_{SHGC}$ in Table 13.3.2e reduced by 15%; and

(iii) incorporate insulation with an R-Value of greater than or equal to 0.5; and

(iv) on the lowest storey containing habitable rooms, have either—

(A) a concrete slab-on-ground floor; or

(B) masonry internal walls; or

(c) in climate zone 5 (option b)—

(i) shade the wall with a verandah, balcony, eaves, carport or the like that projects at a minimum angle of 15 degrees in accordance with Figure 13.2.5a; and

(ii) have external glazing that complies with 13.3.2 with the applicable value for $C_{SHGC}$ in Table 13.3.2e reduced by 15%; and

(iii) on the lowest storey containing habitable rooms, have either—

</tbody>
</table>
(A) a concrete slab-on-ground floor; or
(B) masonry internal walls; or

(d) in climate zones 4 and 6 (option a)—
   (i) have external glazing that complies with 13.3.2 with the applicable value for \( C_U \) in Tables 13.3.2d and 13.3.2f reduced by 15%; and
   (ii) incorporate insulation with an R-Value of greater than or equal to 0.5; and
   (iii) on the lowest storey containing habitable rooms, have either—
      (A) a concrete slab-on-ground floor; or
      (B) masonry internal walls; or

(e) in climate zones 4 and 6 (option b), have external glazing that complies with 13.3.2 with the applicable value for \( C_U \) in Tables 13.3.2d and 13.3.2f reduced by 20%; or

(f) in climate zones 4 and 6 (option c)—
   (i) incorporate insulation with an R-Value of greater than or equal to 1.0; and
   (ii) on the lowest storey containing habitable rooms, have either—
      (A) a concrete slab-on-ground floor; or
      (B) masonry internal walls; or

(g) in climate zone 7 (option a)—
   (i) have external glazing that complies with 13.3.2 with the applicable value for \( C_U \) in Table 13.3.2g reduced by 15%; and
   (ii) incorporate insulation with an R-Value of greater than or equal to 1.0; or

(h) in climate zone 7 (option b)—
   (i) have external glazing that complies with 13.3.2 with the applicable value for \( C_U \) in Table 13.3.2g reduced by 20%; and
   (ii) incorporate insulation with an R-Value of greater than or equal to 0.5; or
   (i) in climate zone 7 (option c), incorporate insulation with an R-Value of greater than or equal to 1.5; or
   (j) in climate zone 8, achieve a minimum of 3.8.

(4) A wall in (2) that—
   (a) has lightweight external cladding such as weatherboards, fibre-cement or metal sheeting fixed to the metal frame; and
   (b) does not have a wall lining or has a wall lining that is fixed directly to the metal frame (see Figure 13.2.5b and 13.2.5c),
   must have a thermal break, consisting of a material with an R-Value greater than or equal to 0.2, installed between the external cladding and the metal frame.

(5) A wall constructed in accordance with Figure 13.2.5b to 13.2.5i is deemed to have the specified in that Figure.
Figure 13.2.5a: Measurement of a projection for wall shading

Figure Notes:
Guttering can be considered as providing shading if attached to a shading projection.

Figure 13.2.5e: Concrete blockwork masonry external wall construction — Total R-Value of 0.54

Figure 13.2.5f: Cavity clay masonry external wall construction — Total R-Value of 0.69
Figure 13.2.5g: Externally insulated clay masonry (reverse clay masonry veneer) external wall construction — Total R-Value of 0.53

Figure 13.2.5h: Externally insulated concrete masonry external wall construction — Total R-Value of 0.46
Explanatory Information:

1. In 13.2.5(1), surface density is the mass on one vertical square metre of wall.
2. In 13.2.5(2), guttering can be considered as providing shading if attached to a shading projection.
3. The thermal performance of metal and timber-framed walls is affected by conductive thermal bridging by the framing members and convective thermal bridging at gaps between the framing and any added bulk insulation. Metal framed walls are more prone to conductive thermal bridging than timber-framed walls.
4. Because of the high thermal conductance of metal, a thermal break is needed when a metal framing member directly connects the external cladding to the internal lining or the internal environment. The purpose of the thermal break is to ensure that the thermal performance of the metal framed wall is comparable to that of a similarly clad timber-framed wall.
5. A thermal break may be provided by materials such as timber battens, plastic strips or polystyrene insulation sheeting. The material used as a thermal break must separate the metal frame from the cladding and achieve the specified $R$-Value.
6. For the purposes of 13.2.5(4)(b), expanded polystyrene strips greater than or equal to 12 mm thickness and timber greater than or equal to 20 mm thickness are deemed to achieve an $R$-Value greater than or equal to 0.2.
7. The $R$-Value of the thermal break is not included when calculating the Total $R$-Value of the wall, if the thermal break is only applied to the metal frame, because this calculation is done for locations free of framing members.
8. Figures 13.2.5a to 13.2.5i provide examples of typical types of wall construction. The additional $R$-Value required can be calculated by subtracting the inherent Total $R$-Value of the typical wall construction in Figures 13.2.5a to 13.2.5i from the required Total $R$-Value. The inherent Total $R$-Value of the typical wall construction has been arrived at by adding together the $R$-Values for outdoor air film, wall cladding or veneer, wall cavity or airspace, internal lining and internal air film. Where a cavity or airspace is filled the Total $R$-Value should be reduced by 0.17 to take account for the loss of the cavity or airspace.
9. Reflective insulation with one reflective surface having an emittance and direction as indicated, is considered to achieve the following $R$-Values when used in conjunction with the Total $R$-Value of a wall construction, as described in Figures 13.2.5a to 13.2.5i. The actual $R$-Value added by reflective insulation should be determined for each product in accordance with the standard prescribed in 13.2.2(1), which takes into consideration factors such as the
number of adjacent airspaces, dimensions of the adjacent airspace, whether the airspace is ventilated and the presence of an anti-glare coating.

10. For further information on reflective insulation, refer to the explanatory information following 13.2.2.

11. Walls with a surface density of 220 kg/m² or more are deemed to achieve acceptable levels of thermal performance in certain climate zones due to their ability to store heat and therefore slow the heat transfer through the building fabric. These walls are defined by surface density (kg/m²), which is the mass of one vertical square metre of wall, in order to reduce the complexity when measuring the mass of walls with voids.

12. The following are examples of some typical wall constructions that achieve a surface density of 220 kg/m²:
   a. Two leaves each of 90 mm thick or greater clay or concrete masonry.
   b. 140 mm thick or greater dense-weight hollow concrete or clay blocks with—
      i. 10 mm plasterboard or render; and
      ii. at least one concrete grouted horizontal bond beam; and
      iii. vertical cores filled with concrete grout at centres not exceeding 1000 mm.
   c. 140 mm thick or greater concrete wall panels and dense-weight hollow concrete or clay blocks with all vertical cores filled with concrete grout.
   d. 190 mm thick or greater dense-weight hollow concrete or clay blocks with—
      i. at least one concrete grouted horizontal bond beam; and
      ii. vertical cores filled with concrete grout at centres not exceeding 1800 mm.
   e. Earth-wall construction with a minimum wall thickness of 200 mm.

13.2.6 Floors

[2019: 3.12.1.5]

1. A suspended floor, other than an intermediate floor in a building with more than one storey—
(a) must achieve the specified in Table 13.2.6a; and

(b) with an in-slab or in-screed heating or cooling system, must be insulated—
   (i) around the vertical edge of its perimeter with insulation having an \textit{R-Value} greater than or equal to 1.0; and
   (ii) underneath the slab with insulation having an \textit{R-Value} greater than or equal to 2.0 which may include insulation installed to meet the requirements of (a); and

(c) that is enclosed beneath, must have a barrier installed at or below floor level to prevent convection within the wall cavity, from the airspace under the floor.

(2) A floor is deemed to have the specified in Table 13.2.6b and Table 13.2.6a.

(3) A concrete slab-on-ground—
   (a) with an in-slab or in-screed heating or cooling system, must have insulation with an \textit{R-Value} greater than or equal to 1.0, installed around the vertical edge of its perimeter; and
   (b) when in climate zone 8, must be insulated—
      (i) around the vertical edge of its perimeter with insulation having an \textit{R-Value} greater than or equal to 1.0; and
      (ii) underneath the slab with insulation having an \textit{R-Value} greater than or equal to 2.0.

(4) Insulation required by (3)(a) and (3)(b)(i) must—
   (a) be water resistant; and
   (b) be continuous from the adjacent finished ground level—
      (i) to a depth of greater than or equal to 300 mm; or
      (ii) for at least the full depth of the vertical edge of the concrete slab-on-ground (see Figure 13.2.6).

(5) The requirements of (1)(b), and (3)(a) do not apply to an in-screed heating or cooling system used solely in a bathroom, amenity area or the like.

<td>0.46</td>
<td>0.46</td>
</tr>
</tbody>
</table>

**Table Notes:**
1. The height of the floor is measured from ground surface to the underside of the floor or the insulation.
2. For the purposes of calculating the $R$-Value of a floor, the $R$-Value attributable to an in-slab or in-screed heating or cooling system is ignored.
Explanatory Information:

1. An enclosed perimeter treatment means that the airspace under the floor is enclosed between ground and floor level by walls which have only the required subfloor vents.
2. The barrier required by 13.2.6(1)(c) could be an imperforate flashing.
3. Specific solutions for concrete slab and timber floors can be found in documents and online resources prepared by industry associations and product suppliers.
4. Tables 13.2.6b and 13.2.6c provide examples of the inherent Total R-Values of enclosed and unenclosed suspended floors of two typical types of construction. Any added R-Value can be calculated by subtracting the inherent R-Value of the typical construction in Tables 13.2.6b and 13.2.6c from the required Total R-Value in Table 13.2.6a.
5. Any non-reflective building membrane fixed between or under floor joists is considered to add an R-Value of 0.2 to the Total R-Value of the base construction described in Tables 13.2.6b and 13.2.6c. Reflective insulation will achieve a higher value which will need to be determined for each product in accordance with relevant standards. Typically, a reflective building membrane attached beneath the floor joists of an unenclosed floor, with a single bright side facing upwards to a 90 mm airspace, can add an R-Value of 0.43 for heat flow upwards and 1.32 for heat flow downwards. Double sided reflective insulation with a 90 mm airspace installed under an enclosed floor can add an R-Value of 0.55 for heat flow upwards and 1.97 for heat flow downwards. Both examples allow for dust on the upper surface.
6. A reflective or non-reflective building membrane should be installed with due consideration of potentially damaging condensation in some climate zones and associated interaction with adjoining building materials.
7. For further information on reflective insulation, refer to the explanatory information accompanying Figures 13.2.3a to 13.2.3d.
8. 13.2.6(5) provides an exemption for an in-screed heating or cooling system used solely in bathrooms, amenity areas and the like, as these are typically small areas.
9. Care should be taken to ensure that the type of termite management system selected is compatible with the slab edge insulation.
13.2.7 Attached Class 10a buildings

A Class 10a building attached to a Class 1 building must—

(a) have an external fabric that achieves the required level of thermal performance for a Class 1 building; or

(b) be separated from the Class 1 building with construction having the required level of thermal performance for the Class 1 building; or

(c) in climate zone 5—

(i) be enclosed with masonry walls other than where there are doors and glazing; and

(ii) be separated from the Class 1 building with a masonry wall that extends to the ceiling or roof; and

(iii) achieve a Total R-Value in the roof equivalent to that required by Tables 13.2.3a to 13.3.2h as appropriate for the Class 1 building; and

(iv) not have a garage door facing the east or west orientation other than if the Class 1 building complies with 13.3.2 with the applicable value for $C_{SHGC}$ in Tables 13.3.2a to 13.3.2h as appropriate reduced by 15%.

Explanatory Information:

The attachment of a Class 10a building, such as a garage, glasshouse, solarium, pool enclosure or the like should not compromise the thermal performance of the Class 1 building. In addition, the Class 10a building may be insulated and so assist the Class 1 building achieve the required thermal performance.

Explanatory Figure 13.2.7 below depicts examples of a Class 1 building with an attached Class 10a garage.
In (a), the thermal performance required for the Class 1 building may be achieved by including the walls and floor of the Class 1 building that adjoin the Class 10a garage.

In (b), the thermal performance required for the Class 1 building may be achieved by including the outside walls and floor of the Class 10a garage.

In (c), in climate zone 5, the thermal performance of the Class 1 building may be achieved by ensuring that the roof of the Class 10a building satisfies Tables 13.2.3a to 13.2.3h and the walls are of masonry construction.
13.3.1 Application of Part 13.3

(1) This Part applies to—
   (a) a Class 1 building; and
   (b) a Class 10a building with a conditioned space.

(2) Part 13.3 must be applied as directed in H6D2(1)(a) or (b).

13.3.2 External glazing

(1) The aggregate conductance of the in each storey, including any mezzanine, of a building must—
   (a) not exceed the allowances resulting from—
      (i) in climate zone 1, multiplying the area of the storey, including any mezzanine, measured within the enclosing walls, by the constant $C_U$ obtained from Table 13.3.2a; and
      (ii) in climate zones 2 to 8, using the constant $C_U$ obtained from Tables 13.3.2b to 13.3.2h, as appropriate; and
   (b) be calculated in accordance with the following calculation—
      (i) in climate zone 1: $(A1 \times U1) + (A2 \times U2) + (A3 + U3) + \ldots$, where—
         (A) $A1,2,etc$ = the area of each element; and
         (B) $U1,2,etc$ = the Total System U-Value of each element; and
      (ii) in climate zones 2 to 8: $[(A1 + U1) + (A2 + U2) + \ldots] / [(A1 \times SHGC1 \times EW1) + (A2 \times SHGC2 \times EW2) + \ldots]$, where—
         (A) $A1,2,etc$ = the area of each element; and
         (B) $U1,2,etc$ = the Total System U-Value of each element; and
         (C) $SHGC1,2,etc$ = the for each glazing element; and
         (D) $EW1, W2, etc$ = the winter exposure factor for each glazing element obtained from Tables 13.3.2i to 13.3.2o.

(2) The aggregate solar heat gain of the in each storey, including any mezzanine, of a building must—
   (a) not exceed the allowances resulting from multiplying the area of the storey, including any mezzanine, measured within the enclosing walls, by the constant $C_{SHGC}$ obtained from Tables 13.3.2a to 13.3.2h, as appropriate; and
   (b) be calculated in accordance with the following calculation: $(A1 \times SHGC1 \times ES1) + (A2 \times SHGC2 \times ES2) + \ldots$, where—
      (i) $A1,2,etc$ = the area of each element; and
      (ii) $SHGC1,2,etc$ = the for each glazing element; and
      (iii) $ES1,2,etc$ = the summer exposure factor for each glazing element obtained from Tables 13.3.2p to 13.3.2w.

(3) For the purposes of Tables 13.3.2a to 13.3.2h, the following applies:
   (a) A storey has Standard air movement if all habitable rooms comply with .
(b) A storey has High air movement if the total ventilation opening area serving the habitable room is—

(i) in climate zones 1, 2, 3, 4 and 5, not less than that for Standard air movement without a ceiling fan or evaporative cooler, but with ceiling fans complying with 13.5.4 installed in all habitable rooms; or

(ii) greater than or equal to twice that for Standard air movement without a ceiling fan or evaporative cooler.

(c) Where the ventilation opening area serving the habitable rooms is between Standard and High, interpolation may be used to determine the applicable CSHGC.

(d) Where the floor construction of a storey, including a mezzanine, is partly in direct contact with the ground and partly suspended, the constants for conductance and solar heat gain are to be—

(i) interpolated between the constants for the two constructions in proportion to their respective areas; or

(ii) those for a suspended floor.

(4) For the purposes of this clause—

(a) summer and winter exposure for each climate zone must be determined in accordance with Tables 13.3.2i to 13.3.2w; and

(b) orientation sectors are as shown in Figure 13.3.2a; and

(c) p and h are to be measured using the method shown in Figure 13.3.2b.

Figure Notes:
1. An external shading device that complies with 13.3.3(b) is considered to achieve a P/H value of 2.00.
2. Where G exceeds 500 mm, the value of P must be halved.
Explanatory Information: Exposure factors
1. Winter exposure factors are not needed for climate zone 1.
2. For exposure factors between those in Tables 13.3.2i to 13.3.2o, either use the next highest P/H or interpolate.
3. For exposure factors between those in Tables 13.3.2p to 13.3.2w, either use the next lowest P/H or interpolate.

Explanatory Information: Conductance and performance values for external glazing
1. The conductance formula for climate zone 1 differs from the formula for all other Climate zones because there is little or no need for heating at any time of the year in climate zone 1. The conductance allowance is calculated to limit the rate of heat conduction through glazing into an air conditioned interior from a hotter outside environment. The limit is set at a level that allows the use of basic glazing systems in dwellings with average glazing areas whether or not they are air conditioned.
2. The conductance formula for climate zones 2 to 8 is based on wintertime conditions to account for the balance between potential solar gains and heat loss by conduction through glazing. The calculation favours orientations with higher potential solar gains in winter and the use of shading rather than glass toning. The improved insulation performance of glazing resulting from the calculations will also be beneficial under summertime conditions when outside temperatures exceed inside temperatures.
3. By referring to “glazing elements”, 13.3.2 requires and Total System SHGCs to be assessed for the combined effect of glass and frames. The measurement of these and Total System SHGCs is specified in the Technical Protocols and Procedures Manual for Energy Rating of Fenestration Products by the Australian Fenestration Rating Council (AFRC).
4. Various assessors using AFRC procedures might refer to their published performance values by slightly different terms including “U-factor” or “Uw” for or “SHGC” for Total System SHGC. Such values can be used under 13.3.2 provided they measure the combined glass and frame performance according to AFRC requirements.
5. and Total System SHGC are shown for some simple types of glazing elements in the table below. Lower figures indicate better glazing performance, although its effect on a dwelling’s energy efficiency can vary depending on the climate and orientation of the glazing. Explanatory Table 13.3.2a gives worst case assessments, which can be improved by obtaining generic or custom product assessments from suppliers, manufacturers, industry associations (including their online resources) and from competent assessors.
6. Typical ranges of generic ratings are set out in Explanatory Tables 13.2.3b to 13.3.2e below to illustrate the levels of performance available through such assessments. Numbers from this table should not be used in compliance calculations.
7. Custom assessments consider glazing element components in most detail and return the highest levels of assessed performance for a given type of glazing element. Generic assessments consider the components of glazing elements in less detail and return lower levels of assessed performance.
8. The calculations for conductance and solar heat gain both consider seasonal solar radiation, orientation, shading and the solar performance of the glazing.

Explanatory Information: Tables 13.3.2a to 13.3.2h

1. A floor in direct contact with the ground includes a concrete slab-on-ground or concrete slab-on-fill.
2. A suspended floor includes a suspended timber floor, suspended steel-framed floor or suspended concrete floor.
3. In general, a floor in direct contact with the ground more readily assimilates solar heat gains than a suspended floor. Consequently, lower stringency levels apply to glazing in a storey that has a floor in direct contact with the ground.
4. Whether a storey has Standard or High air movement depends upon the total ventilation opening area provided to habitable rooms on that storey and the presence of ceiling fans. The additional ventilation opening area required for High air movement without fans can be distributed to any of the habitable rooms on the storey. In climate zones 1 to 5, the storey can achieve High air movement when the total ventilation opening area is as for Standard air movement (without a ceiling fan or evaporative cooler) but with ceiling fans installed in every habitable rooms. Explanatory Table 13.3.2f below shows an example for climate zone 2.
5. The provisions of Part 13.3 assume that internal window coverings will be installed for privacy reasons. This assumption is already incorporated in the allowances for glazing.

<td>High</td>
<td>20%</td>
<td>10%</td>
</tr>
</tbody>
</table>

Explanatory Information: Tables 13.3.2i to 13.3.2w

1. Higher exposure factor (E_{WS}) values in Tables 13.3.2i to 13.3.2o indicate greater exposure to desirable winter solar gains and should be adopted as far as possible.
2. Higher exposure factor (E_{S}) values in Tables 13.3.2p to 13.3.2w indicate greater exposure to unwanted summer
solar gains and should be avoided as far as possible.

### Explanatory Information: Orientation sectors (Figure 13.3.2a)

1. The orientation sector for a wall or glazing element is the sector that contains a line drawn perpendicular to the face of the wall or glazing element.

2. Figure 13.3.2a is based on True North and all angles are measured clockwise from True North. Survey angles on site plans are usually marked in angles from True North. These angles can be used to establish True North for a particular site.

3. Magnetic North, found by a magnetic compass, varies from True North over time and by different amounts in different locations. Magnetic North is not an acceptable approximation of True North.

4. The eight orientation sectors shown in Figure 13.3.2a do not overlap at their boundaries. For example, north sector begins just clockwise after the NNW line and ends exactly on the NNE line. The start and end of other sectors are determined in a similar way, as indicated by the outer curved arrows.

### 13.3.3 Shading

Where shading is required to comply with 13.3.2, it must—

(a) be provided by an external permanent projection, such as a verandah, balcony, fixed canopy, eaves, shading hood or carport, which—
   (i) extends horizontally on both sides of the glazing for a distance greater than or equal to the projection distance P in Figure 13.3.2b; or
   (ii) provide the equivalent shading to (i) with a reveal or the like; or

(b) be provided by an external shading device, such as a shutter, blind, vertical or horizontal building screen with blades, battens or slats, which—
   (i) is capable of restricting at least 80% of the summer solar radiation; and
   (ii) if adjustable, is readily operated either manually, mechanically or electronically by the building occupants.

### Explanatory Information:

1. Shading devices can include fixed louvres, shading screens and other types of perforated or fixed angle slatted shades. However, such devices need to be designed for the climate and latitude to ensure that summer sun penetration is restricted, while winter sun access is achieved. Winter access refers to the availability of winter solar gains to offset conducted heat losses.

2. The impact of shading is assessed with respect to the solar heat gain for the window. The requirements of 13.3.2 consider solar heat gain to be either beneficial or detrimental to the energy efficiency of a building based on seasonal variation (winter/summer), climate zone, orientation and P/H. Higher P/H values are more beneficial in minimising summer solar heat gain where as lower P/H values are more beneficial in allowing winter access.

3. Gutters can only be considered as providing shading if attached to a shading projection such as a verandah, fixed canopy, eaves, shading hood, balcony or the like.

4. Shading devices can be either attached or located adjacent to the building. For example, a free-standing lattice screen may be considered to provide shading to glazing if it complies with 13.3.3(b).

5. An adjustable shading device in 13.3.3(b)(ii) should be readily operated from a safe location or platform that does not require ladders, rigging, harnessing, or the like.
### Part 13.4 Building sealing

#### 13.4.1 Application of Part 13.4

[2019: 3.12.3]

(1) This Part applies to—
   
   (a) a Class 1 building; and
   
   (b) a Class 10a building with a *conditioned space*.

(2) The provisions of (1) do not apply to the following:
   
   (a) A building in *climate zones* 1, 2, 3 and 5 where the only means of air-conditioning is by using an evaporative cooler.
   
   (b) A permanent building *ventilation opening* that is necessary for the safe operation of a gas appliance.

(3) *Part 13.4* must be applied as directed in H6D2(1)(a) or (b).

---

**Explanatory Information:**

1. An evaporatively cooled building in *climate zones* 4 and 6 must be sealed because of the likelihood of the building being heated during colder periods.

2. Appropriate ventilation requirements for gas appliances can be obtained from relevant legislation, referenced standards and product installation manuals.

#### 13.4.2 Chimneys and flues

[2019: 3.12.3.1]

The chimney or flue of an open solid-fuel burning appliance must be provided with a damper or flap that can be closed to seal the chimney or flue.

---

**Explanatory Information:**

1. The requirements of this Part are to be read in conjunction with the fire safety requirements in Section 9 of the ABCB Housing Provisions.

2. A solid-fuel burning appliance is a heater that burns materials such as timber, coal and the like. This clause does not apply to gas and liquid fuel burning appliances.

#### 13.4.3 Roof lights

[2019: 3.12.3.2]

(1) A *roof light* must be sealed, or capable of being sealed, when serving—
   
   (a) a *conditioned space*; or
   
   (b) a *habitable room* in *climate zones* 4, 5, 6, 7 and 8.

(2) A *roof light required* by (1) to be sealed, or capable of being sealed, must be constructed with—
   
   (a) an imperforate ceiling diffuser or the like installed at the ceiling or internal lining level; or
   
   (b) a weatherproof seal; or
   
   (c) a shutter system readily operated either manually, mechanically or electronically by the occupant.
Explanatory Information:
A roof light should be sealed regardless of which room it serves in climate zones 4, 5, 6, 7 and 8. For example, a roof light located in a hallway should be sealed to stop the transfer of cold air into adjoining conditioned spaces. This principle also applies to external doors and windows, exhaust fans, wall and floor junctions and evaporative coolers.

13.4.4 External windows and doors

(1) An external door, internal door between a Class 1 building and an unconditioned Class 10a building, openable window and other such opening must be sealed when serving—
(a) a conditioned space; or
(b) a habitable room in climate zones 4, 5, 6, 7 and 8.

(2) A seal to restrict air infiltration—
(a) for the bottom edge of a door, must be a draft protection device; and
(b) for the other edges of a door or the edges of an openable window or other such opening, may be a foam or rubber compressible strip, fibrous seal or the like.

(3) A window complying with the maximum air infiltration rates specified in AS 2047 need not comply with (2)(b).

13.4.5 Exhaust fans

An exhaust fan must be fitted with a sealing device such as a self-closing damper, filter or the like when serving—
(a) a conditioned space; or
(b) a habitable room in climate zones 4, 5, 6, 7 and 8.

Explanatory Information:
An exhaust fan is considered to be adequately sealed if it is fitted with a filter such as the type commonly used in kitchen range hoods.

13.4.6 Construction of ceilings, walls and floors

(1) Ceilings, walls, floors and any opening such as a window frame, door frame, roof light frame or the like must be constructed to minimise air leakage in accordance with (2) when forming part of the external fabric of—
(a) a conditioned space; or
(b) a habitable room in climate zones 4, 5, 6, 7 and 8.

(2) Construction required by (1) must be—
(a) enclosed by internal lining systems that are close fitting at ceiling, wall and floor junctions; or
(b) sealed at junctions and penetrations with—
   (i) close-fitting architrave, skirting or cornice; or
   (ii) expanding foam, rubber compressible strip, caulking or the like.

Explanatory Information:
1. A close fitting internal lining system is considered suitable to include an allowance for minimum lining movement gaps at wall, floor and ceiling junctions.
2. Caulking includes sealant, mastic or other gap filling material.
3. In 13.4.6(2)(b), penetrations include *windows*, doors, *roof lights*, flues, exhaust fans, heating and cooling ductwork and the like.

### 13.4.7 Evaporative coolers

An evaporative cooler must be fitted with a self-closing damper or the like when serving—

(a) a heated space; or

(b) a *habitable room* in *climate zones* 4, 5, 6, 7 or 8.

**Explanatory Information:**

The self-closing damper should create an effective seal against air infiltration.
Part 13.5  Air movement

13.5.1  Application of Part 13.5

(1) This Part applies to a habitable room in a Class 1 building.

(2) Part 13.5 must be applied as directed in H6D2(1)(a) or (b).

13.5.2  Air movement

(1) Air movement must be provided to habitable rooms in accordance with Table 13.5.2.

(2) Air movement required by (1) may be provided through an opening from an adjoining room (including an enclosed verandah) if—
   (a) the adjoining room is not a sanitary compartment; and
   (b) the opening between the adjoining room and the habitable room complies with Table 13.5.2 as if it were a ventilation opening to the habitable room or a proportion thereof if some ventilation is provided from another source; and
   (c) the ventilation opening to the adjoining room complies with Table 13.5.2 for the floor area of the adjoining room and the proportion of the habitable room that is ventilated from the adjoining room.

(3) The requirements of (1) do not apply to buildings in Region D severe tropical cyclone areas (see Figure 2.2.3 provided the external walls are shaded with a verandah, balcony, eaves, carport or the like that projects at a minimum angle of 15 degrees in accordance with Figure 13.2.5a.

Table 13.5.2: Minimum total ventilation opening area as a percentage of the floor area for each habitable room

Table Notes:
Because evaporative coolers are less effective than ceiling fans in more humid locations, the requirement for ventilation opening in climate zones 1, 2 and 5 with an evaporative cooler is the same as without one.

Explanatory Information:
In humid locations, such as Darwin and Cairns, evaporative coolers would not provide the same cooling effect as in drier climates. Although they would provide some benefit from air movement if operated in ‘fan-only’ mode, they would cause discomfort, possible condensation and possible mould growth if operated in evaporative ‘water-on’ mode. However, even though a concession is not given in climate zones 1, 2 and 5, there are location, particularly in climate zone 5, where evaporative coolers would be effective.
13.5.3 Ventilation openings

[2019: 3.12.4.2]

(1) In climate zones 1, 2, 3, 4 and 5, the total ventilation opening area required by Table 13.5.2 to a habitable room must—

(a) be connected by a breeze path complying with (2) to another ventilation opening in another room or space; or

(b) be provided by a minimum of two ventilation openings located within the same habitable room, with each ventilation opening having an area of not less than 25% of the area required by Table 13.5.2.

(2) A breeze path required by (1)(a) must—

(a) pass through not more than two openings in the internal walls with each opening having an area of not less than 1.5 m²; and

(b) have a distance along the breeze path between ventilation openings of not more than 20 m.

Explanatory Information:

1. Ventilation openings should be designed to allow the interior of the building to take full advantage of any natural breeze. Careful consideration should be given to the type and location of openings to ensure optimum effect is achieved and that internal ‘dead air’ pockets are avoided.

2. An opening may serve more than one breeze path.

3. Two openings are stated in (2)(a) as limit of the number of openings permitted in a breeze path. These are typically doorways. Larger openings, such as those between adjoining lounge and dining areas in the same space are unlikely to restrict air movement significantly.

13.5.4 Ceiling fans and evaporative coolers

[2019: 3.12.4.3]

Ceiling fans or evaporative coolers required to comply with H6D3, Tables 13.3.2a to 13.2.3h, as appropriate or Table 13.5.2 must—

(a) be permanently installed; and

(b) have a speed controller; and

(c) for ceiling fans, serve the whole room, with the floor area that a single fan serves not exceeding—

(i) 15 m² if it has a blade rotation diameter of greater than or equal to 900 mm; and

(ii) 25 m² if it has a blade rotation diameter of greater than or equal to 1200 mm.
13.6.1 Application of Part 13.6

(1) This Part applies to—
   (a) a Class 1 building; and
   (b) a Class 10a building; and
   (c) a Class 10b swimming pool associated with a Class 1 or 10a building.

(2) Part 13.6 must be applied as directed in H6D2(2).

(3) For a heated water supply system, Part 13.6 need not be complied with if H6D2(2)(b) is complied with.

13.6.2 Insulation of services

Thermal insulation for central heating water piping and heating and cooling ductwork must—

(a) be protected against the effects of weather and sunlight; and
(b) be able to withstand the temperatures within the piping or ductwork; and
(c) use thermal insulation material in accordance with AS/NZS 4859.1.

Explanatory Information:
The central heating water piping provisions apply to systems designed to heat the building via water, such as a hydronic heating system.

13.6.3 Central heating water piping

(1) Central heating water piping that is not within a conditioned space must be thermally insulated to achieve the minimum material R-Values as set out in (2) to (6).

(2) Internal piping including—
   (a) flow and return piping that is—
       (i) within an unventilated wall space; or
       (ii) within an internal floor between storeys; or
       (iii) between ceiling insulation and a ceiling; and
   (b) heated water piping encased within a concrete floor slab (except that which is part of a floor heating system), must, in all climate zones, have a minimum material R-Value of 0.4.

(3) Piping located within a ventilated wall space, an enclosed building subfloor or a roof space, including—
   (a) flow and return piping; and
   (b) cold water supply piping within 500 mm of the connection to the central water heating system; and
   (c) relief valve piping within 500 mm of the connection to the central water heating system, must have a minimum material R-Value in accordance with (5).

(4) Piping located outside the building or in an unenclosed building subfloor or roof space, including—
   (a) flow and return piping; and
(b) cold water supply piping within 500 mm of the connection to the central water heating system; and
(c) relief valve piping within 500 mm of the connection to the central water heating system,

must have a minimum material R-Value in accordance with (3).

(5) Piping referred to in (3) must have a minimum material R-Value of—
(a) in climate zones 1, 2, 3 and 5 — 0.6; and
(b) in climate zones 4, 6 and 7 — 0.9; and
(c) in climate zone 8 — 1.3.

(6) Piping referred to in (4) must have a minimum material R-Value of—
(a) in climate zones 1, 2, 3 and 5 — 0.6; and
(b) in climate zones 4, 6 and 7 — 1.3; and
(c) in climate zone 8 — 1.3.

Explanatory Information:

1. The insulation levels in the following table are typical examples of materials that can be used to insulate central heating water piping calculated in accordance with AS/NZS 4859.1.

2. The R-Value is that of the insulation and not the Total R-Value of the pipe, air film and insulation. Where piping has a significant inherent R-Value it may be subtracted from the material R-Value required. However, the inherent R-Value of most piping is not sufficient to satisfy the requirements of 13.6.3.

3. Piping within a timber member, such as that passing through a wall stud, is considered to have sufficient insulation for the purposes of 13.6.3.

4. The following table provides examples for the R-Value of the insulation used for smaller diameter piping.

13.6.4 Heating and cooling ductwork

(1) Heating and cooling ductwork and fittings must—
(a) achieve the material R-Value in (4); and
(b) be sealed against air loss—
   (i) by closing all openings in the surface, joints and seams of ductwork with adhesives, mastics, sealants or gaskets in accordance with AS 4254.1 and AS 4254.2 for a Class C seal; or
   (ii) for flexible ductwork, with a draw band in conjunction with a sealant or adhesive tape.

(2) Duct insulation must—
(a) abut adjoining duct insulation to form a continuous barrier; and
(b) be installed so that it maintains its position and thickness, other than at flanges and supports; and
(c) where located outside the building, under a suspended floor, in an attached Class 10a building or in a roof space—
   (i) be protected by an outer sleeve of protective sheething to prevent the insulation becoming damp; and
(ii) have the outer protective sleeve sealed with adhesive tape not less than 48 mm wide creating an airtight and waterproof seal.

(3) The requirements of (1) do not apply to heating and cooling ductwork and fittings located within the insulated building envelope including a service riser within the conditioned space, internal floors between storeys and the like.

(4) The material R-Value required by (1)(a) must be determined in accordance with the following:

(a) In a heating-only system or cooling-only system including an evaporative cooling system—
   (i) ductwork must have a minimum material R-Value of—
      (A) in climate zones 1 to 7 — 1.0; and
      (B) in climate zone 8 — 1.5; and
   (ii) fittings must have a minimum material R-Value of 0.4.

(b) In a combined heating and refrigerated cooling system—
   (i) ductwork must have a minimum material R-Value of—
      (A) in climate zones 1, 3, 4, 6 and 7 — 1.5; and
      (B) in climate zones 2 and 5 — 1.0; and
      (C) in climate zone 8 — 1.5; and
   (ii) fittings must have a minimum material R-Value of 0.4.

(c) For the purposes of (b)(i), the minimum material R-Value required for ductwork may be reduced by 0.5 for combined heating and refrigerated cooling systems in climate zones 1, 3, 4, 6 and 7 if the ducts are—
   (i) under a suspended floor with an enclosed perimeter; or
   (ii) in a roof space that has an insulation of greater than or equal to R0.5 directly beneath the roofing.

Explanatory Information:
1. Ductwork within a fully insulated building may still benefit from insulation particularly when the system is only operating for short periods.
2. In some climate zones condensation may create problems with uninsulated ductwork, in which case insulation should still be considered.
3. For information on an enclosed perimeter, refer to the explanatory information following 13.2.6.
4. Insulation for refrigerated cooling ductwork should have a vapour barrier to prevent possible damage by condensation.
5. The insulation levels in the following tables are typical examples of materials that can be used to insulate ductwork and the R-Values they contribute. Other methods are available for meeting the minimum material R-Value required by 13.6.4(4). These values do not take into account all issues that may reduce the effectiveness of insulation. AS/NZS 4859.1 should be used to confirm in-situ values.
6. For fittings, 11 mm polyurethane typically provides an R-Value of 0.4.
7. Any flexible ductwork used for the transfer of products, initiating from a heat source that contains a flame, must also have the fire hazard properties required by H3D2(2).

13.6.5 Electric resistance space heating

An electric resistance space heating system that serves more than one room must have—

(a) separate isolating switches for each room; and
(b) a separate temperature controller and time switch for each group of rooms with common heating needs; and
(c) power loads of not more than 110 W/m$^2$ for living areas, and 150 W/m$^2$ for bathrooms.

13.6.6 Artificial lighting

(1) The lamp power density or illumination power density of artificial lighting, excluding heaters that emit light, must not exceed the allowance of—

(a) 5 W/m$^2$ in a Class 1 building; and
(b) 4 W/m$^2$ on a verandah, balcony or the like attached to a Class 1 building; and
(c) 3 W/m$^2$ in a Class 10a building associated with a Class 1 building.

(2) The illumination power density allowance in (1) may be increased by dividing it by the relevant illumination power density adjustment factor for a control device in (6) as applicable.

(3) When designing the lamp power density or illumination power density, the power of the proposed installation must be used rather than nominal allowances for exposed batten holders or luminaires.

(4) If halogen lamps are installed, they must be separately switched from fluorescent lamps.

(5) Artificial lighting around the perimeter of a building must—

(a) be controlled by a daylight sensor; or
(b) have an average light source efficacy of not less than 40 Lumens/W.

(6) The following illumination power density adjustment factors apply to control devices for artificial lighting:

(a) Lighting timer for corridor lighting: 0.7.
(b) Motion detector —
   (i) 0.9, where —

</tbody>
</table>
(A) at least 75% of the area of a space is controlled by one or more motion detectors; or

(B) an area of less than 200 m$^2$ is switched as a block by one or more motion detectors; and

(i) 0.7, where up to 6 lights are switched as a block by one or more detectors; and

(ii) 0.55, where up to 2 lights are switched as a block by one or more detectors.

c) Manual dimming system where not less than 75% of the area of a space is controlled by manually operated dimmers: 0.85.

d) Programmable dimming system where not less than 75% of the area of a space is controlled by manually operated dimmers: 0.85.

e) Dynamic dimming system, with automatic compensation for lumen depreciation, the design lumen depreciation factor is not less than —

(i) 0.9 for fluorescent lights; or

(ii) 0.8 for high pressure discharge lights.

(f) Fixed dimming where at least 75% of the area is controlled by fixed dimmers that reduce the overall lighting level and the power consumption of the lighting — equal to the % of full power to which the dimmer is set divided by 0.95.

g) Daylight sensor and dynamic lighting control device, with dimmed or stepped switching of lights adjacent to windows:

(i) Lights within the space adjacent to windows other than roof lights for a distance from the window equal to the depth of the floor at window head height: 0.5.

(ii) Lights within the space adjacent to roof lights: 0.6.

(7) For the purposes of (6)(c), manual dimming is where lights are controlled by a knob, slider or other mechanism or where there are pre-selected scenes that are manually selected.

(8) For the purposes of (6)(d), programmed dimming is where pre-selected scenes or levels are automatically selected by the time of day, photoelectric cell or occupancy sensor.

(9) For the purposes of (6)(e), dynamic dimming is where the lighting level is varied automatically by a photoelectric cell to either proportionately compensate for the availability of daylight or the lumen depreciation of the lamps.

(10) For the purposes of (6)(f), fixed dimming is where lights are controlled to a level and that level cannot be adjusted by the user.

(11) For the purposes of (6)(g)(i) and (ii), the illumination power density adjustment factor is only applied to lights controlled by that item — this adjustment factor does not apply to tungsten halogen or other incandescent sources.

Explanatory Information:

1. There are two approaches available for achieving compliance with (1) in Class 1 and associated Class 10a buildings. These are through the determination of the lamp power density or the illumination power density.

2. The first step in achieving compliance is to determine the relevant lamp power density or illumination power density allowance. Generally, the lamp power density or illumination power density is the relevant value in (1)(a), (b) or (c), however the illumination power density allowance can be increased in accordance with (2) if a control device is used.

3. When illumination power density and one or more control devices are used, the adjustment factor is only applied to the space(s) served by the control device. The adjusted allowance for this space is then combined with the allowances for the remaining spaces using an area weighted average, which subsequently increases the allowance provided in (1)(a), (b) or (c).

4. Where no control device is used the adjustment factor is equal to 1.

5. The second step in achieving compliance is to assess the overall lamp power density or overall illumination power density of the building.

6. The overall lamp power density is calculated by adding the maximum power ratings of all of the permanently wired lamps in a space and dividing this sum by the area of the space.

7. The overall illumination power density is calculated by adding the illumination power load for each space and dividing this sum by the area of the space.

8. Control device factors in (2) are only applied to the illumination power density, not the overall illumination power.
9. To comply with (1), the overall lamp power density or overall illumination power density must be less than or equal to the allowance.

10. Trading of allowances between (1)(a), (b) and (c) is not permitted.

11. (1)(b) includes outdoor living spaces such as verandahs, balconies, patios, alfresco spaces or the like that are attached to a Class 1 building.

12. The artificial lighting requirements in 13.6.6 are to be read in conjunction with the artificial lighting requirements in 10.5.2.

13. The artificial lighting around the perimeter of a building does not need to comply to a maximum power density as neither the lighting required or the area of the space can be easily defined. Instead, external lights are required to be controlled by daylight sensors or to be efficient.

14. In (4), separate switching is required for halogen lamps to facilitate less frequent usage. This is because they are significantly less energy efficient that fluorescent lamps.

### 13.6.7 Water heater in a heated water supply system

A water heater in a heated water supply system must be designed and installed in accordance with Part B2 of NCC Volume Three — Plumbing Code of Australia.

### 13.6.8 Swimming pool heating and pumping

1. Heating for a swimming pool must be by—
   - a solar heater not boosted by electric resistance heating; or
   - a heater using reclaimed energy; or
   - a gas heater; or
   - a heat pump; or
   - a combination of (a) to (d).

2. Where some or all of the heating required by (1) is by a gas heater or a heat pump, the swimming pool must have—
   - a cover unless located in a conditioned space; and
   - a time switch to control the operation of the heater.

3. A time switch must be provided to control the operation of a circulation pump for a swimming pool.

4. For the purposes of 13.6.8, a swimming pool does not include a spa pool.

#### Explanatory Information:

Some jurisdictions may have requirements for a pool cover under the Smart Approved WaterMark Scheme.

### 13.6.9 Spa pool heating and pumping

1. Heating for a spa pool that shares a water recirculation system with a swimming pool must be by—
   - a solar heater; or
   - a heater using reclaimed energy; or
   - a gas heater; or
   - a heat pump; or
(e) a combination of (a) to (d).

(2) Where some or all of the heating required by (1) is by a gas heater or a heat pump, the spa pool must have—
   (a) a cover; and
   (b) a push button and a time switch to control the operation of the heater.

(3) A time switch must be provided to control the operation of a circulation pump for a spa pool having a capacity of 680 L or more.

</table>
Above ground rainwater tank: A rainwater tank that is not in any way set into the ground.

Accessible: Having features to enable use by people with a disability.

Accessway: A continuous accessible path of travel (as defined in AS 1428.1) to, into or within a building.

Accredited Testing Laboratory: One of the following:

(a) An organisation accredited by the National Association of Testing Authorities (NATA) to undertake the relevant tests.

(b) An organisation outside Australia accredited to undertake the relevant tests by an authority recognised by NATA through a mutual recognition agreement.

(c) An organisation recognised as being an Accredited Testing Laboratory under legislation at the time the test was undertaken.

Activity support level: The degree to which occupants can undertake activities with respect to the likely activity traits and occupant traits.

Explanatory Information:

This term is used to articulate whether the height of a room or space is sufficient and by what degree. This is achieved by having regard to the room or space’s intended use by occupants, through consideration of the defined terms ‘activity traits’ and ‘occupant traits’.

(a) For the purposes of Volume One, the features of the activities that will be undertaken in a habitable room or space.

(b) For the purposes of Volume Two, the features of the activities that will be undertaken in a room or space.

Explanatory Information:

This term is used to describe the characteristics of the activities that will be undertaken in a room or space.

For example, the activities likely to be undertaken in a bedroom, and the associated features are—

- sleeping — a person laying horizontally; and
- resting — a person laying horizontally or sitting upright on the bed; and
- leisure activities, such as reading a book — a person sitting upright on the bed, with enough space to stretch their arms vertically; and
- dressing/changing clothes — a person standing with enough space to stretch their arms vertically.

Administering body: The body responsible for administering the WaterMark Certification Scheme.

Aged care building: A Class 9c building for residential accommodation of aged persons who, due to varying degrees of incapacity associated with the ageing process, are provided with personal care services and 24 hour staff assistance to evacuate the building during an emergency.

NSW

Air-conditioning: For the purposes of Section J of Volume One, a service that actively cools or heats the air within a space, but does not include a service that directly—

(a) cools or heats cold or hot rooms; or

(b) maintains specialised conditions for equipment or processes, where this is the main purpose of the service.

Alarm zone: For the purposes of Specification 23, an area of a building protected by one or more smoke alarms connected to one alarm circuit.

Alteration: In relation to a building, includes an addition or extension to a building.

Aluminium Composite Panel (ACP): Flat or profiled aluminium sheet material in composite with any type of materials.

Amenity: An attribute which contributes to the health, physical independence, comfort and well-being of people.
Ancillary element: An element that is secondary to and not an integral part of another element to which it is attached.

Annual exceedance probability: The probability that a given rainfall total accumulated over a given duration will be exceeded in any one year.

Annual greenhouse gas emissions: The theoretical amount of greenhouse gas emissions attributable to the energy used annually by a building’s services, excluding kitchen exhaust and the like.

Appropriate authority: For the purposes of the Fire Safety Verification Method, means the relevant authority with the statutory responsibility to determine the particular matter satisfies the relevant Performance Requirement.

Explanatory Information:
The Appropriate Authority is typically the building surveyor or building certifier charged with the statutory responsibility to determine building compliance and issue the building permit / approval and occupancy certificate / approval.

NSW Appropriate authority

Appropriate authority: The relevant authority with the statutory responsibility to determine the particular matter.

Appropriately qualified person: A person recognised by the appropriate authority as having qualifications and/or experience in the relevant discipline in question.

Approved disposal system: A system for the disposal of sewage, sullage or stormwater approved by an authority having jurisdiction.

Articulated masonry: Masonry construction in which special provisions have been made for movement by articulation.

NSW Assembly building

Assembly building: A building where people may assemble for—

- civic, theatrical, social, political or religious purposes including a library, theatre, public hall or place of worship; or
- educational purposes in a school, early childhood centre, preschool, or the like; or
- entertainment, recreational or sporting purposes including—
  - a discotheque, nightclub or a bar area of a hotel or motel providing live entertainment or containing a dance floor; or
  - a cinema; or
  - a sports stadium, sporting or other club; or
- transit purposes including a bus station, railway station, airport or ferry terminal.

Assessment Method: A method that can be used for determining that a Performance Solution or Deemed-to-Satisfy Solution complies with the Performance Requirements.

Atrium: A space within a building that connects 2 or more storeys and—

- is enclosed at the top by a floor or roof (including a glazed roof structure); and
- includes any adjacent part of the building not separated by an appropriate barrier to fire; but
- does not include a stairwell, rampwell or the space within a shaft; and
- for the purposes of (a) a space is considered enclosed if the area of the enclosing floor or roof is greater than 50% of the area of the space, measured in plan, of any of the storeys connected by the space.

Atrium well: A space in an atrium bounded by the perimeter of the openings in the floors or by the perimeter of the floors and the external walls.

Automatic: Designed to operate when activated by a heat, smoke or fire sensing device.

- The time between ignition of a fire and the onset of untenable conditions in a specific part of a building.
- The time referred to in (1) is the calculated interval between the time of ignition of a fire and the time at which conditions become such that the occupant is unable to take effective action to escape to a place of safety.

Average daylight factor: The ratio of the illumination level within a room provided by daylight to the level of daylight outside the building during overcast conditions.
**Definitions**

**Average recurrence interval:** Applied to rainfall, means the expected or average interval between exceedances for a 5 minute duration rainfall intensity.

**Average specific extinction area:** The average specific extinction area for smoke as determined by AS 5637.1.

**Backflow prevention device:** An air gap, break tank or mechanical device that is designed to prevent the unplanned reversal of flow of water or contaminants into the water service or a Network Utility Operator's water supply.

**Backpressure:** A reversal of water flow caused by the downstream pressure becoming greater than the supply pressure.

**Backsiphonage:** A reversal of flow of water caused by negative pressure in the distributing pipes of a water service or supply.

**Backstage:** A space associated with, and adjacent to, a stage in a Class 9b building for scenery, props, equipment, dressing rooms, or the like.

**Battery system:** One or more chemical cells connected in series, parallel or a combination of the two for the purpose of electrical energy storage.

**Blockage:** An obstruction within a water service or sanitary plumbing or drainage system.

**Boiler:** A vessel or an arrangement of vessels and interconnecting parts, wherein steam or other vapour is generated, or water or other liquid is heated at a pressure above that of the atmosphere, by the application of fire, the products of combustion, electrical power, or similar high temperature means, and—

(a) includes superheaters, reheaters, economisers, boiler piping, supports, mountings, valves, gauges, fittings, controls, the boiler settings and directly associated equipment; but

(b) excludes a fully flooded or pressurised system where water or other liquid is heated to a temperature lower than the normal atmospheric boiling temperature of the liquid.

**Bond breaker:** A material used as part of a waterproofing system that prevents the membrane bonding to the substrate, bedding or lining.

**Breaking surf:** Any area of salt water in which waves break on an average of at least 4 days per week but does not include white caps or choppy water.

**Explanatory Information:**

Breaking surf normally occurs in areas exposed to the open sea. Breaking surf does not normally occur in sheltered areas, such as that which occurs around Port Phillip Bay, Sydney Harbour, Swan River, Derwent River and similar locations.

**Brittle failure:** Loss of strength to resist design actions without first undergoing significant deformation which, for the purposes of the Performance Requirements, may be taken to include (but is not limited to) buckling, fatigue failure and soil bearing failure.

**Building complexity criteria:** Are used to determine whether all or part of a building is low, medium, high or very high building complexity — the building complexity criteria are:

(a) Attributes — the building is designed or constructed with any of the following sub-criteria:

(i) An effective height of more than 25 m.

(ii) One or more Performance Solutions used to demonstrate compliance with Performance Requirements relating to material and systems for structural safety.

(iii) One or more Performance Solutions used to demonstrate compliance with Performance Requirements relating to material and systems for fire safety.

(iv) In an area prone to natural disaster or adverse environmental conditions.

(b) Class 2 — all or part of the building is Class 2 of three or more storeys.

(c) Occupant numbers — the building is to occupied by more than 100 people determined in accordance with D2D18.

(d) Occupant characteristics — the building is to be occupied by more than 10 people who will require assistance to evacuate the building in an emergency.

(e) Building Importance Level 4 — the building is determined to be Importance Level 4 in accordance with Table B1D3a.

**Building complexity: high:** Where a building meets three of building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), or (d) (Occupant characteristics).
Building complexity: low: Where a building meets one only of building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), or (d) (Occupant characteristics).

Building complexity: medium: Where a building meets two of building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), or (d) (Occupant characteristics).

Building complexity: very high: Where a building meets—
(a) all building complexity criteria (a) (Attributes), (b) (Class 2), (c) (Occupant numbers), and (d) (Occupant characteristics); or
(b) building complexity criterion (e) (Building Importance Level 4).

Notes:
The NCC currently does not include corresponding technical requirements relating to the defined term ‘building complexity criteria’ and the various building complexity levels. It is intended that these terms will be integrated into future editions of the NCC.

Buried rainwater tank: A rainwater tank that is set into and completely covered by earth.

Burnout: Exposure to fire for a time that includes fire growth, full development, and decay in the absence of intervention or automatic suppression, beyond which the fire is no longer a threat to building elements intended to perform loadbearing or fire separation functions, or both.

Carpark: A building that is used for the parking of motor vehicles but is neither a private garage nor used for the servicing of vehicles, other than washing, cleaning or polishing.

Cavity: A void between 2 leaves of masonry, or in masonry veneer construction, a void between a leaf of masonry and the supporting frame.

Cavity wall: For the purposes of F1V1 and H2V1, a wall that incorporates a drained cavity.

Certificate of Accreditation: A certificate issued by a State or Territory accreditation authority stating that the properties and performance of a building material or method of construction or design fulfil specific requirements of the NCC.

Certificate of Conformity: A certificate issued under the ABCB scheme for products and systems certification stating that the properties and performance of a building material or method of construction or design fulfil specific requirements of the NCC.

Certification body: A person or organisation operating in the field of material, product, form of construction or design certification that has been accredited by the Joint Accreditation System of Australia and New Zealand (JAS-ANZ), and is accredited for a purpose other than as part of the CodeMark Australia Certification Scheme or WaterMark Certification Scheme.

Characteristic: The occupant data to be used in the modelling of access solutions which define how an occupant interacts with a building, i.e. occupant movement speeds, turning ability, reach capability, perception of luminance contrast and hearing threshold.

Clad frame: Timber or metal frame construction with exterior timber or sheet wall cladding that is not sensitive to minor movement and includes substructure masonry walls up to 1.5 m high.

Climate zone: Climate zone means an area defined in Figure 2 and in Tables 2a to 2h for specific locations, having energy efficiency provisions based on a range of similar climatic characteristics.

Figure 2: Climate zones for thermal design

Figure Notes:

(a) This map can be viewed in enlargeable form on the ABCB website at abc.gov.au.
(b) A Zone 4 area in South Australia, other than a council area, at an altitude greater than 300 m above the Australian Height Datum is to be considered as Zone 5.
(c) The areas referred to in (2) have been defined in an enlarged format on the following maps produced by the Department of Planning, Transport and Infrastructure (these maps can be viewed on the Government of South Australia website at www.sa.gov.au):
   (i) Adelaide Hills Climate Zone Map.
   (ii) Barossa Council Climate Zone Map.
   (iii) Regional Council of Goyder Climate Zone Map.
(d) Locations in climate zone 8 are in alpine areas.

Combustible: Applied to—

(a) a material — means combustible as determined by AS 1530.1; and
(b) construction or part of a building — means constructed wholly or in part of combustible materials.
(a) For the purposes of Volume One, a wall that is common to adjoining buildings.
(b) For the purposes of Volume Two and the ABCB Housing Provisions, a wall that is common to adjoining buildings other than Class 1 buildings.

Condensation: The formation of moisture on the surface of a building element or material as a result of moist air coming into contact with a surface which is at a lower temperature.

(a) For the purposes of Volume One, a space within a building, including a ceiling or under-floor supply air plenum or return air plenum, where the environment is likely, by the intended use of the space, to have its temperature controlled by air-conditioning.
(b) For the purposes of Volume Two, a space within a building that is heated or cooled by the building’s domestic services, excluding a non-habitable room in which a heater with a capacity of not more than 1.2 kW or 4.3 MJ/hour is installed.

Connections: The parts that fix the members into the structure, through which the loads pass.
Construction activity actions: Actions due to stacking of building materials or the use of equipment, including cranes and trucks, during construction or actions which may be induced by floor to floor propping.

Containment protection: The installation of a backflow prevention device at the point of connection of a Network Utility Operator’s water supply to a site.

Contaminant: Any substance (including gases, liquids, solids or micro-organisms), energy (excluding noise) or heat, that either by itself or in combination with the same, similar or other substances, energy or heat, changes or is likely to change the physical, chemical or biological condition of water.

Controlled fill: Material that has been placed and compacted in layers with compaction equipment (such as a vibrating plate) within a defined moisture range to a defined density requirement.

Cooling load: The calculated amount of energy removed from the cooled spaces of the building annually by artificial means to maintain the desired temperatures in those spaces.

Critical radiant flux (CRF): The critical heat flux at extinguishment (CHF in kW/m$^2$) as determined by AS ISO 9239.1.

Cross-connection: Any actual or potential connection between a water supply and any contaminant.

Curtain wall: A non-loadbearing external wall that is not a panel wall.

Damp-proof course (DPC): A continuous layer of impervious material placed in a masonry wall or pier, or between a wall or pier and a floor, to prevent the upward or downward migration of water.

Deemed-to-Satisfy Provisions: Provisions which are deemed to satisfy the Performance Requirements.

Defined flood event (DFE): The flood event selected for the management of flood hazard for the location of specific development as determined by the appropriate authority.

Defined flood level (DFL): The flood level associated with a defined flood event relative to a specified datum (see Figure 3).
Definitions

**NSW Designated bushfire prone area**

**Designated bushfire prone area**: Land which has been designated under a power of legislation as being subject, or likely to be subject, to bushfires.

**Design bushfire**: The characteristics of a bushfire, its initiation, spread and development, which arises from weather conditions, topography and fuel (vegetation) in a given setting, used to determine fire actions.

**Design fire**: The quantitative description of a representation of a fire within the design scenario.

**Design scenario**: The specific scenario of which the sequence of events is quantified and a fire safety engineering analysis is conducted against.

**Design wind speed**: The design gust wind speed for the area where the building is located, calculated in accordance with AS/NZS 1170.2 or AS 4055 (see Table 4.3 for wind classes).

### Wind classes

<table>
<thead>
<tr>
<th>Non-cyclonic Region A and B</th>
<th>Cyclonic Region C and D</th>
</tr>
</thead>
<tbody>
<tr>
<td>N1, N2, N3</td>
<td>C1</td>
</tr>
<tr>
<td>N4, N5, N6 (these wind classes are covered in the Housing Provisions Part 2.2, Structural provisions).</td>
<td>C2, C3, C4 (these wind classes are covered in the Housing Provisions Part 2.2, Structural provisions).</td>
</tr>
</tbody>
</table>

**Table Notes:**

(a) Wind classification map identifying wind regions is contained in Housing Provisions Part 2.2 (see Figure 2.2.3).

(b) Information on wind classes for particular areas may be available from the appropriate authority.
Definitions

“N” = non-cyclonic winds and “C” = cyclonic winds.

Detention centre: A building in which persons are securely detained by means of the built structure including a prison, remand centre, juvenile detention centre, holding cells or psychiatric detention centre.

Direct fix cladding wall: For the purposes of F1V1 and H2V1, means a wall with cladding attached directly to the wall framing without the use of a drained cavity.

(a) A wall having a minimum 20 mm cavity between 2 separate leaves, and—
   (i) for masonry, where wall ties are used to connect leaves, the ties are of the resilient type; and
   (ii) for other than masonry, there is no mechanical linkage between the leaves, except at the periphery.

(b) A staggered stud wall is not deemed to be discontinuous construction.

Display glazing: Glazing used to display retail goods in a shop or showroom directly adjacent to a walkway or footpath, but not including that used in a café or restaurant.

Domestic services: The basic engineering systems that use energy or control the use of energy; and—

(a) includes—
   (i) heating, air-conditioning, mechanical ventilation and artificial lighting; and
   (ii) pumps and heaters for swimming pools and spa pools; and
   (iii) heated water systems; but

(b) excludes cooking facilities and portable appliances.

Drainage: Any part of sanitary drainage, liquid trade waste drainage or stormwater drainage system.

(a) a sanitary drainage system, including any liquid trade waste drainage; or

(b) a stormwater drainage system.

Drainage flange: A flange connected to a waste pipe, at the point at which it passes through the floor substrate, to prevent leakage and which enables tile bed drainage into the waste pipe.

Drainage riser: A waste pipe between the floor waste and the drainage system.

Drinking water: Water intended primarily for human consumption but which has other domestic uses.

Explanatory Information:
See also the Australian Drinking Water Guidelines produced by the National Health and Medical Research Council.

Ductile failure: Significant deformation of a member without loss of strength to resist design actions which, for the purposes of the Performance Requirements, may be taken to include (but not limited to) soil settlement and creep failure.

TAS Early childhood centre

VIC Early childhood centre

Early childhood centre: Any premises or part thereof providing or intending to provide a centre-based education and care service within the meaning of the Education and Care Services National Law Act 2010 (Vic), the Education and Care Services National Regulations and centre-based services that are licensed or approved under State and Territory children’s services law, but excludes education and care primarily provided to school aged children in outside school hours settings.

Effective height: The vertical distance between the floor of the lowest storey included in the calculation of rise in storeys and the floor of the topmost storey (excluding the topmost storey if it contains only heating, ventilating, lift or other equipment, water tanks or similar service units).

Efficacy: The degree to which a system achieves a design objective given that it performs to a level consistent with the system specification during the relevant fire scenario.

Electricity network substation: A building in which high voltage supply is converted or transformed and which is controlled by a licensed network service provider designated under a power of legislation.

Electric passenger lift: A power-operated lift for raising or lowering people in a car in which the motion of the car is obtained from an electric motor mechanically coupled to the hoisting mechanism.

Electrohydraulic passenger lift: A power-operated lift for raising or lowering people in a car in which the motion of the
car is obtained from the action of liquid under pressure acting on a piston or ram, the pressure being generated by a pump driven by an individual electric motor.

**Engaged pier**: A pier bonded to a masonry wall by course bonding of masonry units or by masonry ties.

(a) For the purposes of Section J in Volume One, the parts of a building’s *fabric* that separate a *conditioned space* or *habitable room* from—
   (i) the exterior of the building; or
   (ii) a non-*conditioned space* including—
       (A) the floor of a rooftop plant room, lift-machine room or the like; and
       (B) the floor above a *carpark* or warehouse; and
   (C) the *common wall* with a *carpark*, warehouse or the like.

(b) For the purposes of Part H6 in Volume Two and Section 13 of the Housing Provisions, the parts of a building’s *fabric* that separate artificially heated or cooled spaces from—
   (i) the exterior of the building; or
   (ii) other spaces that are not artificially heated or cooled.

**Equivalent**: Equivalent to the level of health, safety and amenity provided by the *Deemed-to-Satisfy Provisions*.

**Evacuation route**: The continuous path of travel (including *exits*, *public corridors* and the like) from any part of a building, including within a *sole-occupancy unit* in a Class 2 or 3 building or Class 4 part, to a *safe place*.

**Evacuation time**: The time calculated from when the emergency starts for the occupants of the building to evacuate to a *safe place*.

(a) Any, or any combination of the following if they provide egress to a road or *open space*:
   (i) An internal or external stairway.
   (ii) A ramp.
   (iii) A *fire-isolated passageway*.
   (iv) A doorway opening to a road or *open space*.

(b) A *horizontal exit* or a *fire-isolated passageway* leading to a *horizontal exit*.

**TAS Expert Judgement**

**Expert Judgement**: The judgement of an expert who has the qualifications and experience to determine whether a *Performance Solution* or *Deemed-to-Satisfy Solution* complies with the *Performance Requirements*.

**Explanatory Information**:

Contemporary and relevant qualifications and/or experience are necessary to determine whether a *Performance Solution* complies with the *Performance Requirements*. The level of qualification and/or experience may differ depending on the complexity of the proposal and the requirements of the regulatory authority. Practitioners should seek advice from the authority having jurisdiction or *appropriate authority* for clarification as to what will be accepted.

**Exposed joint**: A construction joint, control joint, expansion joint, contraction joint or movement joint that is exposed to *rainwater*.

(a) For the purposes of Volume One, an outer wall of a building which is not a *common wall*.

(b) For the purposes of Volume Two, an outer wall of a building which is not a *separating wall*.

**Extra-low voltage**: A *voltage* not exceeding 50 V AC or 120 V ripple-free DC.

**Fabric**: The basic building structural elements and components of a building including the roof, ceilings, walls, glazing and floors.

**SA Farm building**

**Farm building**: A Class 7 or 8 building located on land primarily used for *farming*—

(a) that is—
   (i) used in connection with *farming*; or
   (ii) used primarily to store one or more *farm vehicles*; or
(iii) a combination of (i) and (ii); and

(b) in which the total number of persons accommodated at any time does not exceed one person per 200 m² of floor area or part thereof, up to a maximum of 8 persons; and

(c) with a total floor area of not more than 3500 m².

**Farming:** Includes—

(a) cultivating, propagating and harvesting plants or fungi or their products or parts, including seeds, spores, bulbs or the like, but does not include forestry; or

(b) maintaining animals in any physical environment for the purposes of—

(i) breeding them; or

(ii) selling them; or

(iii) acquiring and selling their bodily produce such as milk, wool, eggs or the like; or

(c) a combination of (a) and (b),

but does not include forestry or maintaining animals for sport or recreational purposes.

**Farm shed:** A single storey Class 7 or 8 building located on land primarily used for farming—

(a) that is—

(i) used in connection with farming; or

(ii) used primarily to store one or more farm vehicles; or

(iii) a combination of (i) and (ii); and

(b) occupied neither frequently nor for extended periods by people; and

(c) in which the total number of persons accommodated at any time does not exceed 2; and

(d) with a total floor area of more than 500 m² but not more than 2000 m².

**Farm vehicle:** A vehicle used in connection with farming.

**Fatigue failure:** Fracture of a material through progressive brittle cracking under repeated alternating or cyclic stresses of an intensity considerably less than strength under static load.

**Finished ground level:** For the purposes of H1D4 and H2D3 in Volume Two and Section 4 of the Housing Provisions, means the ground level adjacent to footing systems at the completion of construction and landscaping.

**Fire actions:** Each of the following—

(a) airborne embers; and

(b) burning debris and/or accumulated embers adjacent to building elements; and

(c) heat transfer from combustible materials within the site: and

(d) radiant heat from a bushfire front; and

(e) flame contact from a bushfire front.

**Fire brigade:** A statutory authority constituted under an Act of Parliament having as one of its functions, the protection of life and property from fire and other emergencies.

**Fire brigade station:** For the purposes of E1D2(1)(b) and I3D9, means a state or territory government operated premises which is a station for a fire brigade.

**Fire compartment:** Either—

(a) the total space of a building; or

(b) when referred to in—

(i) the Performance Requirements — any part of a building separated from the remainder by barriers to fire such as walls and/or floors having an appropriate resistance to the spread of fire with any openings adequately protected; or

(ii) the Deemed-to-Satisfy Provisions — any part of a building separated from the remainder by walls and/or floors each having an FRL not less than that required for a fire wall for that type of construction and where all openings in the separating construction are protected in accordance with the Deemed-to-Satisfy Provisions of the relevant Part.
**Fire growth**: The stage of fire development during which the *heat release rate* and the temperature of the fire are generally increasing.

**Fire hazard**: The danger in terms of potential harm and degree of exposure arising from the start and spread of fire and the smoke and gases that are thereby generated.

**Fire hazard properties**: The following properties of a material or assembly that indicate how they behave under specific fire test conditions:

(a) *Average specific extinction area*, *critical radiant flux* and *Flammability Index*, determined as defined in Schedule 2.

(b) *Smoke-Developed Index*, *smoke development rate* and *Spread-of-Flame Index*, determined in accordance with Specification 3.

(c) *Group number* and *smoke growth rate index* (SMOGRA\textsubscript{RC}), determined in accordance with Specification 7.

**Fire intensity**: The rate of release of calorific energy in watts, determined either theoretically or empirically, as applicable.

**Fire-isolated passageway**: A corridor, hallway or the like, of *fire-resisting construction*, which provides egress to or from a *fire-isolated stairway* or *fire-isolated ramp* or to a road or *open space*.

**Fire-isolated ramp**: A ramp within a *fire-resisting* enclosure which provides egress from a *storey*.

**Fire-isolated stairway**: A stairway within a *fire-resisting* shaft and includes the floor and roof or top enclosing structure.

(a) The sum of the net calorific values of the *combustible* contents which can reasonably be expected to burn within a *fire compartment*, including furnishings, built-in and removable materials, and building elements.

(b) For the purposes of (1), the calorific values must be determined at the ambient moisture content or humidity (the unit of measurement is MJ).

**Fire-protected timber**: *Fire-resisting* timber building elements that comply with Specification 10.

**Fire-protective covering**: Any one or more of the following:

(a) 13 mm fire-protective grade plasterboard.

(b) 12 mm cellulose cement flat sheeting complying with AS/NZS 2908.2 or ISO 8336.

(c) 12 mm fibrous plaster reinforced with 13 mm x 13 mm x 0.7 mm galvanised steel wire mesh located not more than 6 mm from the exposed face.

(d) Other material not less fire-protective than 13 mm fire-protective grade plasterboard, fixed in accordance with the normal trade practice for a fire-protective covering.

**Fire-resistance level (FRL)**: The grading periods in minutes determined in accordance with Specifications 1 and 2, for the following criteria—

(a) *structural adequacy*; and

(b) *integrity*; and

(c) *insulation*,

and expressed in that order.

**Notes**: A dash means there is no requirement for that criterion. For example, 90/–/– means there is no requirement for an FRL for *integrity* and *insulation*, and –/–/– means there is no requirement for an FRL.

**Fire-resisting construction**: For the purposes of Volume One, means one of the Types of construction referred to in *Part C2* of Volume One.

(a) For the purposes of Volume One, applied to a building element, having an FRL appropriate for that element.

(b) For the purposes of Volume Two, applied to a *structural member* or other part of a building, having the FRL required for that *structural member* or other part.

**Fire safety engineering**: Application of engineering principles, rules and *expert judgement* based on a scientific appreciation of the fire phenomenon, often using specific *design scenario* of the effects of fire and of the reaction and behaviour of people in order to—

(a) save life, protect property and preserve the environment and heritage from destructive fire; and

(b) quantify the hazards and risk of fire and its effects; and
(c) mitigate fire damage by proper design, construction, arrangement and use of buildings, materials, structures, industrial processes and transportation systems; and
(d) evaluate analytically the optimum protective and preventive measures, including design, installation and maintenance of active and passive fire and life safety systems, necessary to limit, within prescribed levels, the consequences of fire.

Fire safety system: One or any combination of the methods used in a building to—
(a) warn people of an emergency; or
(b) provide for safe evacuation; or
(c) restrict the spread of fire; or
(d) extinguish a fire,
and includes both active and passive systems.

Fire-source feature: Any one or more of the following:
(a) The far boundary of a road, river, lake or the like adjoining the allotment.
(b) A side or rear boundary of the allotment.
(c) An external wall of another building on the allotment which is not a Class 10 building.

Fire wall: A wall with an appropriate resistance to the spread of fire that divides a storey or building into fire compartments.

Fixed wired: For the purposes of Specification 23, a system of electrical wiring (either AC or DC), in which cables are fixed or supported in position.

Flammability Index: The index number as determined by AS 1530.2.

Flashing: A strip or sleeve of impervious material dressed, fitted or built-in to provide a barrier to moisture movement, or to divert the travel of moisture, or to cover a joint where water would otherwise penetrate to the interior of a building.
(a) Perimeter flashing: A flashing used at the floor-wall junction.
(b) Vertical flashing: A flashing used at wall junctions within shower areas.

Flashover: In relation to fire hazard properties, means a heat release rate of 1 MW.

Flight: That part of a stair that has a continuous series of risers, including risers of winders, not interrupted by a landing or floor.

Explanatory Information:
A flight is the part of a stair that has a continuous slope created by the nosing line of treads. The length of a flight is limited to restrict the distance a person could fall down a stair.
Quarter landings, as shown in Explanatory Figure 1, are considered sufficient to halt a person’s fall and therefore are considered for the purposes of Volume Two and the ABCB Housing Provisions not to be part of the flight.
**VIC Flood hazard area**

**Flood hazard area**: The *site* (whether or not mapped) encompassing land lower than the *flood hazard level* which has been determined by the *appropriate authority*.

**Flood hazard level (FHL)**: The flood level used to determine the height of floors in a building and represents the *defined flood level* plus the *freeboard* (see Figure 3).

(a) For the purposes of Volume One—

(i) in relation to a building — the total area of all *storeys*; and

(ii) in relation to a *storey* — the area of all floors of that *storey* measured over the enclosing walls, and includes—

(A) the area of a *mezzanine* within the *storey*, measured within the finished surfaces of any *external walls*; and

(B) the area occupied by any *internal wall* or partitions, any cupboard, or other built-in furniture, fixture or fitting; and

(C) if there is no enclosing wall, an area which has a use that contributes to the *fire load* or impacts on the safety, health or amenity of the occupants in relation to the provisions of the BCA; and

(iii) in relation to a room — the area of the room measured within the *internal* finished surfaces of the walls, and includes the area occupied by any cupboard or other built-in furniture, fixture or fitting; and

(iv) in relation to a *fire compartment* — the total area of all floors within the *fire compartment* measured within the finished *internal* surfaces of the bounding construction, and if there is no bounding construction, includes an area which has a use which contributes to the *fire load*; and

(v) in relation to an *atrium* — the total area of all floors within the *atrium* measured within the finished surfaces of the bounding construction and if no bounding construction, within the *external walls*. 
For the purposes of Volume Two and the ABCB Housing Provisions, in relation to a room, the area of the room measured within the finished surfaces of the walls, and includes the area occupied by any cupboard or other built-in furniture, fixture or fitting (see Figure 4).

Figure 4: Identification of floor area of a room

**Floor waste:** A grated inlet within a graded floor intended to drain the floor surface.

**Foundation:** The ground which supports the building (see Figure 5).

Figure 5: Identification of foundation

**Fractional effective dose (FED):** The fraction of the dose (of thermal effects) that would render a person of average susceptibility incapable of escape.

**Explanatory Information:**
The definition for FED has been modified from the ISO definition to be made specific for the Fire Safety Verification Method. The use of CO or CO$_2$ as part of FED is not part of that Verification Method. This is because the ability to measure CO in a repeatable test varies by two orders of magnitude for common cellosic fuel.

**VIC Freeboard**

**Freeboard:** The height above the defined flood level as determined by the appropriate authority, used to compensate for effects such as wave action and localised hydraulic behaviour.

**Fully developed fire:** The state of total involvement of the majority of available combustible materials in a fire.

(a) For the purposes of Section J, a transparent or translucent element and its supporting frame located in the envelope, and includes a window other than a roof light.

(b) For the purposes of Part H6 and Section 13 of the Housing Provisions—

(i) a transparent or translucent element and its supporting frame located in the external fabric of the building; and

(ii) includes a window other than a roof light.

**Going:** The horizontal dimension from the front to the back of a tread less any overhang from the next tread or landing above (see Figure 11.2.2f in the Housing Provisions).
**Definitions**

**Gradual failure**: Relatively slow collapse of a structure that occurs through significant plastic deformation and/or moment redistribution.

**Green Star**: The building sustainability rating scheme managed by the Green Building Council of Australia.

**Group number**: The number of one of 4 groups of materials used in the regulation of fire hazard properties and applied to materials used as a finish, surface, lining, or attachment to a wall or ceiling.

**Habitable room**: A room used for normal domestic activities, and—

(a) includes a bedroom, living room, lounge room, music room, television room, kitchen, dining room, sewing room, study, playroom, family room, home theatre and sunroom; but

(b) excludes a bathroom, laundry, water closet, pantry, walk-in wardrobe, corridor, hallway, lobby, photographic darkroom, clothes-drying room, and other spaces of a specialised nature occupied neither frequently nor for extended periods.

**Hazard Rating**: A level of potential toxicity that may cause contamination in a drinking water system, having aThee e re A of either Low Hazard, Medium Hazard or High Hazard, is determined in accordance with NCC Volume Three, Specification 41, for any Deemed-to-Satisfy Solution.

**Health-care building**: A building whose occupants or patients undergoing medical treatment generally need physical assistance to evacuate the building during an emergency and includes—

(a) a public or private hospital; or

(b) a nursing home or similar facility for sick or disabled persons needing full-time care; or

(c) a clinic, day surgery or procedure unit where the effects of the predominant treatment administered involve patients becoming non-ambulatory and requiring supervised medical care on the premises for some time after the treatment.

**Heated water**: Water that has been intentionally heated; normally referred to as hot water or warm water.

**Heating load**: The calculated amount of energy delivered to the heated spaces of the building annually by artificial means to maintain the desired temperatures in those spaces.

**Heat release**: The thermal energy produced by combustion (measured in kJ).

**Heat release rate (HRR)**: The rate of thermal energy production generated by combustion, measured in kW (preferred) or MW.

**High Hazard**: Any condition, device or practice which, in connection with a water supply, has the potential to cause death.

**High wind area**: A region that is subject to design wind speed more than N3 or C1 (see Table 3).

**Hob**: The upstand at the perimeter to a shower area.

**Horizontal exit**: A required doorway between 2 parts of a building separated from each other by a fire wall.

**Hours of operation**: The number of hours when the occupancy of the building is greater than 20% of the peak occupancy.

(a) For the purposes of Volume One, means software accredited under the Nationwide House Energy Rating Scheme.

(b) For the purposes of Volume Two—

(i) applied to H6V2—software accredited or previously accredited under the Nationwide House Energy Rating Scheme and the additional functionality provided in non-regulatory mode; and

(ii) applied to H6D3—software accredited under the Nationwide House Energy Rating Scheme.

**Explanatory Information**:

The Nationwide House Energy Rating Scheme (NatHERS) refers to the Australian Government’s scheme that facilitates consistent energy ratings from software tools which are used to assess the potential thermal efficiency of dwelling envelopes.

**Housing Provisions**: The requirements for Class 1 and 10 buildings referenced in Volume Two of the National Construction Code, as published by the Australian Building Codes Board.

**Illuminance**: The luminous flux falling onto a unit area of surface.

**Illumination power density**: The total of the power that will be consumed by the lights in a space, including any lamps, ballasts, current regulators and control devices other than those that are plugged into socket outlets for intermittent use such as floor standing lamps, desk lamps or work station lamps, divided by the area of the space, and expressed
Explanatory Information:
Illumination power density relates to the power consumed by the lighting system and includes the light source or luminaire and any control device. The power for the lighting system is the illumination power load. This approach is more complicated than the lamp power density approach but provides more flexibility for a dwelling with sophisticated control systems.

The area of the space refers to the area the lights serve. This could be considered a single room, open plan space, verandah, balcony or the like, or the total area of all these spaces.

**Importance Level**: A number which ranks the relative importance of structures and buildings (shown in Table 3) based on the potential risk to life resulting from their scale and/or use.

Table 3: Importance Levels for building types

<table>
<thead>
<tr>
<th>Importance Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Structures presenting a low degree of hazard to life and other property</td>
</tr>
<tr>
<td>2</td>
<td>Normal structures and structures not in other Importance Levels</td>
</tr>
<tr>
<td>3</td>
<td>Structures that as a whole may contain people in crowds or contents of high value to the community or pose risks to people in crowds</td>
</tr>
<tr>
<td>4</td>
<td>Structures with special post-disaster functions</td>
</tr>
<tr>
<td>5</td>
<td>Special structures</td>
</tr>
</tbody>
</table>

Explanatory Information:
Examples of Importance Levels of certain buildings, structures and facilities

(a) **Importance Level 1**, include but not limited to:
   (i) Structures with a total floor area < 30 m².
   (ii) Farm buildings, isolated structures, towers in rural situations.

(b) **Importance Level 2**, include but not limited to:
   (i) Buildings not included in Importance Level 1, 3 or 4.
   (ii) Single family dwellings.

(c) **Importance Level 3**, include but not limited to:
   (i) Where more than 300 people can congregate in one area.
   (ii) Day care facilities with a capacity greater than 150.
   (iii) Primary school or secondary school facilities with a capacity greater than 250.
   (iv) Colleges or adult education facilities with a capacity greater than 500.
   (v) Health care facilities with a capacity of 50 or more residents.
   (vi) Airport terminals, principal railway stations with a capacity greater than 250.
   (vii) Correctional institutions.
   (viii) Multi-occupancy residential, commercial (including shops), industrial, office and retailing buildings designed to accommodate more than 5000 people and with a gross area greater than 10,000 m².
   (ix) Public assembly buildings, theatres and cinemas of greater than 1,000 m².
   (x) Emergency medical and other emergency facilities not designated as post-disaster.
   (xi) Power-generating facilities, water treatment and waste-water treatment facilities and other public utilities not designated as post-disaster.
   (xii) Buildings and facilities not designated as post-disaster containing hazardous materials capable of causing hazardous conditions that do not extend beyond the property boundaries.

(d) **Importance Level 4**, include but not limited to:
Definitions

(i) Buildings and facilities designated as essential facilities buildings and facilities with special post-disaster functions medical emergency or surgical facilities.

(ii) Emergency service facilities such as fire, police stations and emergency vehicle garages.

(iii) Utilities or emergency supplies or installations required as backup for buildings and facilities of Importance Level 4.

(iv) Designated emergency shelters, designated emergency centres and ancillary facilities.

(v) Buildings and facilities containing hazardous materials capable of causing hazardous conditions that extend beyond the property boundaries.

(e) Importance Level 5, include but not limited to:

(i) Structures that have special functions or whose failure poses catastrophic risk to a large area (e.g. 100 km²) or a large number of people (e.g. 100,000).

(ii) Major dams, extreme hazard facilities.

Inclined lift: A power-operated device for raising or lowering people within a carriage that has one or more rigid guides on an inclined plane.

Individual protection: The installation of a backflow prevention device at the point where a water service connects to a single fixture or appliance.

Individual risk: The frequency at which an individual may be expected to sustain a given level of harm from the realisation of a specified hazard.

Insulation: In relation to an FRL, the ability to maintain a temperature on the surface not exposed to the furnace below the limits specified in AS 1530.4.

Integrity: In relation to an FRL, the ability to resist the passage of flames and hot gases specified in AS 1530.4.

(a) For the purposes of Volume One, excludes a common wall or a party wall.

(b) For the purposes of Volume Two, excludes a separating wall, common wall or party wall.

Interstitial condensation: The condensation of moisture on surfaces between material layers inside the building component.

Irrigation system: An irrigation system of the following types:

(a) Type A— all permanently open outlets and piping more than 150mm above finished ground level, not subject to ponding or back-pressure and not involving injection systems.

(b) Type B— irrigation systems in domestic or residential buildings with piping or outlets installed less than 150mm above finished surface level and not involving injection systems.

(c) Type C— irrigation systems in other than domestic or residential buildings with piping outlets less than 150mm above finished surface level and not involving injection systems.

(d) Type D— irrigation systems where fertilizers, herbicides, nemacides or the like are injected or siphoned into the system.

JAS-ANZ: The Joint Accreditation System of Australia and New Zealand.

Lamp power density: The total of the maximum power rating of the lamps in a space, other than those that are plugged into socket outlets for intermittent use such as floor standing lamps, desk lamps or work station lamps, divided by the area of the space, and expressed in W/m².

Explanatory Information:

Lamp power density is a simple means of setting energy consumption at an efficient level for Class 1 and associated Class 10a buildings.

Lamp refers to the globe or globes that are to be installed in a permanently wired light fitting. The maximum power of a lamp is usually marked on the fitting as the maximum allowable wattage.

The area of the space refers to the area the lights serve. This could be considered a single room, open plan space, verandah, balcony or the like, or the total area of all these spaces.

Landing: An area at the top or bottom of a flight or between two flights.

Latent heat gain: The heat gained by the vapourising of liquid without change of temperature.
**Lateral support:** A support (including footing, buttress, cross wall, beam, floor or braced roof structure) that effectively restrains the wall or pier at right angles to the face of the wall or pier.

**Lightweight construction:** Construction which incorporates or comprises—
(a) sheet or board material, plaster, render, sprayed application, or other material similarly susceptible to damage by impact, pressure or abrasion; or
(b) concrete and concrete products containing pumice, perlite, vermiculite, or other soft material similarly susceptible to damage by impact, pressure or abrasion; or
(c) masonry having a width of less than 70 mm.

**Loadbearing:** Intended to resist vertical forces additional to those due to its own weight.

**Loadbearing wall:** For the purposes of H1D4, H2D3 and Section 4 of the Housing Provisions, means any wall imposing on the footing a load greater than 10 kN/m.

**Loss:** Physical damage, financial loss or loss of amenity.

**Low Hazard:** Any condition, device or practice which, in connection with a water supply, would constitute a nuisance by colour, odour or taste but does not have the potential to injure or endanger health.

**Low lead:** Where a plumbing product or material in contact with drinking water is calculated using a weighted average lead content of no more than 0.25%.

**Low rainfall intensity area:** An area with a 5 minute rainfall intensity for an annual exceedance probability of 5% average recurrence interval of 20 years of not more than 125 mm/hour.

**Explanatory Information:**
Rainfall intensity figures can be obtained from Tables 7.4.3d to 7.4.3k in the Housing Provisions.

**Low-rise, low-speed constant pressure lift:** A power-operated low-rise, low-speed device for raising or lowering people with limited mobility on a carriage that is controlled by the application of constant pressure to a control.

**Low-rise platform lift:** A power-operated device for raising or lowering people with limited mobility on a platform, that is controlled automatically or by the application of constant pressure to a control.

**Low voltage:** A voltage exceeding extra-low voltage, but not exceeding 1000 V AC or 1500 V DC.

**Luminance contrast:** The light reflected from one surface or component, compared to the light reflected from another surface or component.

**Massive timber:** An element not less than 75 mm thick as measured in each direction formed from solid and laminated timber.

**Maximum acceptable annual probability of structural failure of structures, buildings, members and connections:** The probability that, in any year, there could be a structural failure leading to collapse of either the whole of the structure or building, or significant members and/or their connections, expressed as 1 in … (e.g. 1 in 1,000 meaning a probability of 1 in 1,000 that the failure could occur).

**Maximum retained water level:** The point where surface water will start to overflow out of the shower area.

**Medium Hazard:** Any condition, device or practice which, in connection with a water supply, has the potential to injure or endanger health.

**Members:** The parts of a structure or component that provide resistance to structural actions.

**Members and connections that do not provide primary building support:** Those components of a building or other structure that are not necessary to resist collapse of other members, parts of the building or the whole building, including but are not limited to—
(a) non-loadbearing walls including framing, wall cladding, roof cladding, roof purlins and battens, mezzanine floors; and
(b) connections and fixings that fix in position only those members that do not provide primary building support.

**Members and connections that provide primary building support:** Those components of a building or other structure that provide the structural system resisting collapse of other members, parts of the building or the whole building under the design actions, including but are not limited to—
(a) beams, columns, trusses, portal frames, posts, loadbearing walls, floor systems, footings, foundations and earth retaining structures; and
(b) connections and fixings that transfer loads between members that provide primary building support.

**Membrane:** A barrier impervious to moisture.

**Explanatory Information:**
A barrier may be a single or multi-part system.

**Mezzanine:** An intermediate floor within a room.

**Minimum Acceptable Annual Structural Reliability Index of Structures, Buildings, Members and Connections:** The Structural Reliability Index ($\beta$), determined in accordance with the ABCB Structural Reliability Handbook (Version 2022.1) that corresponds to the maximum acceptable annual probability of structural failure tabulated in Table B1P1.

**Mixed construction:** A building consisting of more than one form of construction, particularly in double-storey buildings.

**Mould:** A fungal growth that can be produced from conditions such as dampness, darkness, or poor ventilation.

**Multiple resistance paths:** Situations where the failure of a part of a building or structure is resisted collectively by more than one member or connection, such that the failure of any member or connection will result in the transfer of loads to the other members and connections with sufficient combined capacity to resist the total applied loads.

**NABERS Energy for Apartment Buildings:** The National Australian Built Environment Rating System for apartment building energy efficiency, which is managed by the New South Wales Government.

**NABERS Energy for Hotels:** The National Australian Built Environment Rating System for hotel building energy efficiency, which is managed by the New South Wales Government.

**NABERS Energy for Offices:** The National Australian Built Environment Rating Systems for office energy efficiency, which is managed by the New South Wales Government.

**NABERS Energy for Shopping Centres:** The National Australian Built Environment Rating System for shopping centre energy efficiency, which is managed by the New South Wales Government.

**TAS Network Utility Operator**

**Network Utility Operator:** A person who—
(a) undertakes the piped distribution of drinking water or non-drinking water for supply; or
(b) is the operator of a sewerage system or a stormwater drainage system.

**Explanatory Information:**
A Network Utility Operator in most States and Territories is the water and sewerage authority licensed to supply water and receive sewage and/or stormwater. The authority operates or proposes to operate a network that undertakes the distribution of water for supply and undertakes to receive sewage and/or stormwater drainage. This authority may be a licensed utility, local government body or council.

(a) Applied to a material — means not deemed combustible as determined by AS 1530.1 — Combustibility Tests for Materials.

(b) Applied to construction or part of a building — means constructed wholly of materials that are not deemed combustible.

**Non-drinking water:** Water which is not intended primarily for human consumption, but which may have other uses, drinking water.

**Non-transient actions:** The combination of structural actions in which the combined magnitude of the permanent gravity action and imposed gravity action is equal to or greater than 50% of the magnitude of the total combined actions.
(a) For the purposes of Volume One, the features, needs and profile of the occupants in a habitable room or space.
(b) For the purposes of Volume Two, the features, needs and profile of the occupants in a room or space.

**Explanatory Information:**
For the purpose of Volume Two, this term is used to describe the characteristics of the occupants and their associated requirements in relation to a room or space.
For example, in relation to a bedroom, the following occupant characteristics and associated requirements should be considered:

- Characteristics: height, mobility and how often the space will be used.
- Requirements: a sleeping space and a space to undertake leisure activities.

**Occupiable outdoor area:** A space on a roof, balcony or similar part of a building—

(a) that is open to the sky; and
(b) to which access is provided, other than access only for maintenance; and
(c) that is not open space or directly connected with open space.

**TAS On-site wastewater management system**

**On-site wastewater management system:** A system installed on premises that receives and/or treats wastewater generated and discharges on the premises and applies the resulting effluent to an approved disposal system or reuse system.

**Open-deck carpark:** A carpark in which all parts of the parking storeys are cross-ventilated by permanent unobstructed openings in not fewer than 2 opposite or approximately opposite sides, and—

(a) each side that provides ventilation is not less than \( \frac{1}{6} \) of the area of any other side; and
(b) the openings are not less than \( \frac{1}{2} \) of the wall area of the side concerned.

**Open space:** A space on the allotment, or a roof or similar part of a building adequately protected from fire, open to the sky and connected directly with a public road.

**Open spectator stand:** A tiered stand substantially open at the front.

**Other property:** All or any of the following—

(a) any building on the same or an adjoining allotment; and
(b) any adjoining allotment; and
(c) a road.

**Outdoor air:** Air outside the building.

**Outdoor air economy cycle:** A mode of operation of an air-conditioning system that, when the outdoor air thermodynamic properties are favourable, increases the quantity of outdoor air used to condition the space.

**Outfall:** That part of the disposal system receiving surface water from the drainage system and may include a natural water course, kerb and channel, or soakage system.

**Overflow devices:** A device that provides relief to a water service, sanitary plumbing and drainage system, rainwater service harvesting system or stormwater system to avoid the likelihood of uncontrolled discharge.

**Panel wall:** A non-loadbearing external wall, in frame or similar construction, that is wholly supported at each storey.

**Partially buried rainwater tank:** A rainwater tank that is not completely covered by earth but is partially set into the ground.

**Patient care area:** A part of a health-care building normally used for the treatment, care, accommodation, recreation, dining and holding of patients including a ward area and treatment area.

**Performance-based design brief (PBDB):** The process and the associated report that defines the scope of work for the performance-based analysis, the technical basis for analysis, and the criteria for acceptance of any relevant Performance Solution as agreed by stakeholders.

**Performance Requirement:** A requirement which states the level of performance which a Performance Solution or Deemed-to-Satisfy Solution must meet.

**Performance Solution:** A method of complying with the Performance Requirements other than by a Deemed-to-Satisfy Solution.

**Perimeter of building:** For the purposes of Section 8 of the Housing Provisions, means the external envelope of a building.

**Personal care services:** Any of the following:

(a) The provision of nursing care.
(b) Assistance or supervision in—
   (i) bathing, showering or personal hygiene; or
(ii) toileting or continence management; or
(iii) dressing or undressing; or
(iv) consuming food.

(c) The provision of direct physical assistance to a person with mobility problems.
(d) The management of medication.
(e) The provision of substantial rehabilitative or development assistance.

Piping: For the purposes of Section J in Volume One or Part H6 in Volume Two, and Section 13 of the Housing Provisions, means an assembly of pipes, with or without valves or other fittings, connected together for the conveyance of liquids and gases.

Pliable building membrane: A water barrier as classified by AS/NZS 4200.1.

Plumbing: Any water service plumbing or roof plumbing, sanitary plumbing system or heating, ventilation and air-conditioning plumbing.

Plumbing or Drainage Solution: A solution which complies with the Performance Requirement and is a—
(a) Performance Solution; or
(b) Deemed-to-Satisfy Solution; or
(c) combination of (a) and (b).

Point of connection: Any of the following:
(a) For a heated water service means the point where the water heater connects to the cold water service downstream of the isolation valve.
(b) For sanitary plumbing means the point where the sanitary plumbing system connects to the sanitary drainage system.
(c) For sanitary drainage sewage disposal means the point where the on-site sanitary drainage drainage system connects to the Network Utility Operator’s sewerage system or to an on-site wastewater management system.
   (i) the Network Utility Operator’s sewerage system; or
   (ii) an on-site wastewater management system.
(d) For stormwater disposal means the point where the on-site stormwater drainage system connects to the Network Utility Operator’s stormwater system or to an approved disposal system.
   (i) the Network Utility Operator’s stormwater system; or
   (ii) an approved on-site disposal system.
(e) For a fire-fighting water service means the point where the service connects to—
   (i) a cold water service, downstream of a backflow prevention device; or
   (ii) the Network Utility Operator’s water supply system; or
   (iii) the point of isolation to an alternative water source.
(f) For a cold water service means the point where the cold water service connects to—pipe within the premises connects to the Network Utility Operator’s property service or to an alternative water supply system.
   (i) the Network Utility Operator’s water supply system; or
   (ii) the point of isolation to an alternative water source where there is no Network Utility Operator’s water supply available or is not utilised.
(g) For a rainwater service means the point where the rainwater service connects to the point of isolation to the rainwater storage.

Notes:
A domestic fire sprinkler service conforming to FPAA101D is considered part of the cold water service.

Explanatory Information:
The point of connection is usually determined by the Network Utility Operator according to the water and sewerage

**Definitions**

**Acts, Regulations and codes that apply within the Network Utility Operator’s licensed area and/or jurisdiction.**

**Point of discharge:** The outlet of a—

(a) tap or outlet that discharges water over plumbing fixtures; or

(b) cistern inlet valve or flushing device of a sanitary fixture; or

(c) water service used for the connection of an appliance which is readily accessible and easily connected or disconnected; or

(d) tap, outlet or end of line valve where water is discharged to the atmosphere under normal operating conditions; or

(e) isolating valve or the outlet provided for the connection of industrial or specialist equipment to the water service; or

(f) backflow prevention device connected to a fire service or irrigation system; or

(g) relief drain line or vent pipe from a water heater, temperature and pressure relief valve or expansion control valve.

**Explanatory Information:**

The point of discharge of a tap or fixture commonly includes the outlets of a basin or bath taps, shower heads, drinking fountains, flush valves or cistern inlet valves.

The point of discharge of a water service used for the connection of an appliance commonly includes outlets of an isolation valve provided for the connection of dishwashers, clothes washers, coffee machines and fridges with beverage dispensing and ice making capabilities.

The point of discharge for a tap discharging to atmosphere may include hose cocks. It does not include any subsequent connections to this outlet such as garden hoses.

Contamination control may be required to avoid contamination of the water service where a hazard exists beyond the point of discharge.

Water services downstream of the backflow prevention device are considered an unprotected water service.

**Predicted Mean Vote (PMV):** The Predicted Mean Vote of the thermal perception of building occupants determined in accordance with ANSI/ASHRAE Standard 55.

**Preformed shower base:** A preformed, prefinished vessel installed as the finished floor of a shower compartment, and which is provided with a connection point to a sanitary drainage system.

**Explanatory Information:**

Shower bases are commonly made of plastics, composite materials, vitreous enamelled pressed steel, or stainless steel.

**Pressure vessel:** A vessel subject to internal or external pressure, including interconnected parts and components, valves, gauges and other fittings up to the first point of connection to connecting piping, and—

(a) includes fire heaters and gas cylinders; but

(b) excludes—

(i) any vessel that falls within the definition of a boiler; and

(ii) storage tanks and equipment tanks intended for storing liquids where the pressure at the top of the tank is not exceeding 1.4 kPa above or 0.06 kPa below atmospheric pressure; and

(iii) domestic-type hot water supply heaters and tanks; and

(iv) pressure vessels installed for the purposes of fire suppression or which serve a fire suppression system.

**QLD Primary building element**

(a) For the purposes of Volume One, a member of a building designed specifically to take part of the loads specified in B1D3 and includes roof, ceiling, floor, stairway or ramp and wall framing members including bracing members designed for the specific purpose of acting as a brace to those members.

(b) For the purposes of Part 3.4 of the Housing Provisions, means a member of a building designed specifically to
Definitions

take part of the building loads and includes roof, ceiling, floor, stairway or ramp and wall framing members including bracing members designed for the specific purpose of acting as a brace to those members.

Explanatory Information:
The loads to which a building may be subjected are dead, live, wind, snow and earthquake loads. Further information on building loads can be found in the AS 1170 series of Standards.

Private bushfire shelter: A structure associated with, but not attached to, or part of a Class 1a dwelling that may, as a last resort, provide shelter for occupants from immediate life threatening effects of a bushfire.

(a) For the purposes of Volume One—
   (i) any garage associated with a Class 1 building; or
   (ii) any single storey of a building of another Class containing not more than 3 vehicle spaces, if there is only one such storey in the building; or
   (iii) any separate single storey garage associated with another building where such garage contains not more than 3 vehicle spaces.

(b) For the purposes of Volume Two—
   (i) any garage associated with a Class 1 building; or
   (ii) any separate single storey garage associated with another building where such garage contains not more than 3 vehicle spaces.

Product: Plumbing and drainage items within the scope of Volume Three including but not limited to—

(a) materials, fixtures and components used in a plumbing or drainage installation; and
(b) appliances and equipment connected to a plumbing or drainage system.

Product Technical Statement: A form of documentary evidence stating that the properties and performance of a building material, product or form of construction fulfil specific requirements of the NCC, and describes—

(a) the application and intended use of the building material, product or form of construction: and
(b) how the use of the building material, product or form of construction complies with the requirements of the NCC Volume One and Volume Two; and
(c) any limitations and conditions of the use of the building material, product or form of construction relevant to (b).

TAS Professional engineer

Professional engineer: A person who is—

(a) if legislation is applicable — a registered professional engineer in the relevant discipline who has appropriate experience and competence in the relevant field; or
(b) if legislation is not applicable—
   (i) registered in the relevant discipline on the National Engineering Register (NER) of the Institution of Engineers Australia (which trades as ‘Engineers Australia’); or
   (ii) eligible to become registered on the Institution of Engineers Australia’s NER and has appropriate experience and competence in the relevant field.

Public corridor: An enclosed corridor, hallway or the like which—

(a) serves as a means of egress from 2 or more sole-occupancy units to a required exit from the storey concerned; or
(b) is required to be provided as a means of egress from any part of a storey to a required exit.

Rainwater service harvesting system: A water service which distributes water from the isolation valve of the rainwater storage to the rainwater points of discharge for purposes such as for clothes washing, urinal and water closet flushing and external hose cocks. A plumbing installation that comprises—

A plumbing installation that comprises—

(a) any plumbing that connects a rainwater tank to any drinking water or non-drinking water outlets; and any top-up line that conveys drinking water from a Network Utility Operator’s water supply to a rainwater tank.

Rainwater storage: Any storage of rainwater collected from a roof catchment area which is used to supply water for the
primary purposes of drinking, personal hygiene or other uses.

Notes:
Generally this applies to water which is not supplied by a Network Utility Operator. This does not include rainwater storage for non-drinking purposes.

Rapid roller door: A door that opens and closes at a speed of not less than 0.5 m/s.

TAS Recognised expert

Recognised expert: A person with qualifications and experience in the area of plumbing or drainage in question recognised by the authority having jurisdiction.

Explanatory Information:
A recognised expert is a person recognised by the authority having jurisdiction as qualified to provide evidence under A5G4(5). Generally, this means a hydraulic consultant or engineer, however the specific requirements are determined by the authority having jurisdiction.

Under A5G4(5), a report from a recognised expert may be used as evidence of suitability that a product listed on the WaterMark Schedule of Excluded Products, or a plumbing or drainage system, complies with a Performance Requirement or Deemed-to-Satisfy Provisions.

(a) For the purposes of Volume One, a hypothetical building that is used to calculate the maximum allowable annual greenhouse gas emissions and determine the thermal comfort level for the proposed building.

(b) For the purposes of Volume Two, means a hypothetical building that is used to determine the maximum allowable heating load and cooling load for the proposed building.

Reflective insulation: A building membrane with a reflective surface such as a reflective foil laminate, reflective barrier, foil batt or the like capable of reducing radiant heat flow.

Explanatory Information:
For Volume Two:

(a) Typical R-Value achieved by adding reflective insulation are given in the explanatory information accompanying Section 13 of the Housing Provisions. Information on specific products may be obtained from reflective insulation manufacturers.

(b) The surface of reflective insulation may be described in terms of its emittance (or infra-red emittance) or in terms of its reflectance (or solar reflectance). Generally, for the surface of a particular reflective insulation –

(c) emittance + reflectance = 1.

(d) Some types of reflective insulation may also serve the purposes of waterproofing or vapour proofing.

Regulated energy: The energy consumed by a building’s services minus the amount of renewable energy generated and used on site.

Reinforced masonry: Masonry reinforced with steel reinforcement that is placed in a bed joint or grouted into a core to strengthen the masonry.

Reliability: The probability that a system performs to a level consistent with the system specification.

Renewable energy: Energy that is derived from sources that are regenerated, replenished, or for all practical purposes cannot be depleted and the energy sources include, but are not limited to, solar, wind, hydroelectric, wave action and geothermal.

Reportable fire: A fire that would be reported to the fire brigade.

Required: Required to satisfy a Performance Requirement or a Deemed-to-Satisfy Provision of the NCC as appropriate.

Required safe egress time (RSET): The time required for safe evacuation of occupants to a place of safety prior to the onset of untenable conditions.

Residential aged care building: A Class 3 or 9a building whose residents, due to their incapacity associated with the ageing process, are provided with physical assistance in conducting their daily activities and to evacuate the building during an emergency.
Residential care building: A Class 3, 9a or 9c building which is a place of residence where 10% or more of persons who reside there need physical assistance in conducting their daily activities and to evacuate the building during an emergency (including any aged care building or residential aged care building) but does not include a hospital.

Resident use area: Part of a Class 9c building normally used by residents, and—
(a) includes sole-occupancy units, lounges, dining areas, activity rooms and the like; but
(b) excludes offices, storage areas, commercial kitchens, commercial laundries and other spaces not for the use of residents.

Resistance to the incipient spread of fire: In relation to a ceiling membrane, means the ability of the membrane to insulate the space between the ceiling and roof, or ceiling and floor above, so as to limit the temperature rise of materials in this space to a level which will not permit the rapid and general spread of fire throughout the space.

Explanatory Information:
Resistance to the incipient spread of fire refers to the ability of a ceiling to prevent the spread of fire and thermally insulate the space between the ceiling and the roof or floor above. “Resistance to the incipient spread of fire” is superior to “fire-resistance” because it requires a higher standard of heat insulation.

The definition is used in Volume Two for separating floors/ceilings for a Class 1a dwelling located above a non-appurtenant private garage.

Rise in storeys: The greatest number of storeys calculated in accordance with C2D3 of Volume One.

Riser: The height between consecutive treads and between each landing and continuous tread.

Rolled fill: Material placed in layers and compacted by repeated rolling by an excavator.

Roof light: For the purposes of Section J and Part F4 in Volume One, Part H6 in Volume Two, and Part 10.5 and Section 13 of the Housing Provisions, a skylight, window or the like installed in a roof—
(a) to permit natural light to enter the room below; and
(b) at an angle between 0 and 70 degrees measured from the horizontal plane.

R-Value: The thermal resistance of a component calculated by dividing its thickness by its thermal conductivity, expressed in m².K/W.

Safe place: Either—
(a) a place of safety within a building—
(i) which is not under threat from a fire; and
(ii) from which people must be able to safely disperse after escaping the effects of an emergency to a road or open space; or
(b) a road or open space.

Sanitary compartment: A room or space containing a closet pan or urinal (see Figures 6a and 6b).
Figure 6a: Identification of a sanitary compartment (diagram a)
Figure 6b: Identification of a sanitary compartment (diagram b)

**Sarking-type material:** A material such as a *reflective insulation* or other flexible membrane of a type normally used for a purpose such as waterproofing, vapour management or thermal reflectance.

**School:** Includes a primary or secondary school, college, university or similar educational establishment.

**Screed:** A layer of material (usually cement based) of defined minimum thickness which sets in situ between a structural base and the finished floor material.

**Self-closing:** Is defined—

(a) For the purposes of Volume One, applied to a door, means equipped with a device which returns the door to the fully closed position immediately after each opening.

(b) For the purposes of Volume Two, applied to a door or *window*, means equipped with a device which returns the door or *window* to the fully closed and latched position immediately after each manual opening.

**Self draining:** Materials, systems or ballast that—

(a) are above the structural substrate; and

(b) have sufficient gaps or openings to permit drainage of rainwater to a membrane on the structural substrate below.

**Sensible heat gain:** The heat gained which causes a change in temperature.

**Separating element:** A barrier that exhibits fire *integrity, structural adequacy, insulation*, or a combination of these for a period of time under specified conditions (often in accordance with AS 1530.4).

**Separating wall:** A wall that is common to adjoining Class 1 buildings (see Figure 7).
Definitions

Figure 7: Separating wall

**Figure Notes:**

In Volume Two a separating wall may also be known as a party wall and typically is **required** to be **fire-resisting** construction (see Housing Provisions Parts and ).

**Service:** For the purposes of Section J in Volume One, means a mechanical or electrical system that uses energy to provide **air-conditioning**, mechanical ventilation, heated water supply, artificial lighting, vertical transport and the like within a building, but which does not include—

(a) systems used solely for emergency purposes; and
(b) cooking facilities; and
(c) portable appliances.

**Service station:** A garage which is not a **private garage** and is for the servicing of vehicles, other than only washing, cleaning or polishing.

**Shaft:** The walls and other parts of a building bounding—

(a) a well, other than an **atrium well**; or
(b) a vertical chute, duct or similar passage, but not a chimney or flue.

**Shower area:** The area affected by water from a shower, including a shower over a bath.

(a) **Enclosed** — The area enclosed by walls or screens including hinged or sliding doors that control the spread of water to within the enclosure but excludes—

(i) a shower fitted with a frameless or semi frameless shower screen, shower curtain or the like; and
(ii) a shower fitted over a bath with a screen less than 1500 mm long.

(b) **Unenclosed** — The area where, under normal use, water out of the shower rose is not contained within 1500 mm of the shower rose.

**Shower screen:** The panels, doors or windows enclosing or partially enclosing a shower area.

**Single leaf masonry:** Outer walls constructed with a single thickness of masonry unit.

**Single resistance paths:** Situations where the failure of a part of a building or structure is resisted by only one member or connection, such that the failure of that member or connection will result in the collapse of a significant part of the building or structure.

**Site:** The part of the allotment of land on which a building stands or is to be erected.

**Situwork:** Work on or around a site, including earthworks, preparatory to or associated with the construction, alteration, demolition or removal of a building.

**Small-scale Technology Certificate:** A certificate issued under the Commonwealth Government’s Small-scale Renewable Energy Scheme.

**Small-sized, low-speed automatic lift:** A restricted use power-operated device for the infrequent raising or lowering of people with limited mobility on a platform that is controlled automatically but has the capability of being electrically isolated by a key-lockable control.

**Smoke-and-heat vent:** A vent, located in or near the roof for smoke and hot gases to escape if there is a fire in the
Definitions

Smoke-Developed Index: The index number for smoke as determined by AS/NZS 1530.3.

Smoke development rate: The development rate for smoke as determined by testing flooring materials in accordance with AS ISO 9239.1.

Smoke growth rate index (SMOGRA<sub>RC</sub>): The index number for smoke used in the regulation of fire hazard properties and applied to materials used as a finish, surface, lining or attachment to a wall or ceiling.

Societal risk: Frequency and the number of people suffering from a specified level of harm in a given population from the realisation of specified hazards.

Solar admittance: The fraction of incident irradiance on a wall-glazing construction that adds heat to a building’s space.

Sole-occupancy unit: A room or other part of a building for occupation by one or joint owner, lessee, tenant, or other occupier to the exclusion of any other owner, lessee, tenant, or other occupier and includes—

(a) a dwelling; or
(b) a room or suite of rooms in a Class 3 building which includes sleeping facilities; or
(c) a room or suite of associated rooms in a Class 5, 6, 7, 8 or 9 building; or
(d) a room or suite of associated rooms in a Class 9c building, which includes sleeping facilities and any area for the exclusive use of a resident.

Spandrel panel: For the purposes of Section J, means the opaque part of a façade in curtain wall construction which is commonly adjacent to, and integrated with, glazing.

Specialist equipment: Equipment used within hospitality or health care industries which is installed by specialist technicians.

Notes:
Examples may include medical equipment, commercial chemical or beverage dispensers, dental chairs or similar specialist equipment.

Spiral stairway: A stairway with a circular plan, winding around a central post with steps that radiate from a common centre or several radii (see Figures 11.2.2d and 11.2.2e in the Housing Provisions).

Spread-of-Flame Index: The index number for spread of flame as determined by AS/NZS 1530.3.

Sprinkler alarm switch: For the purposes of Specification 23, a device capable of sending an electrical signal to activate an alarm when a residential sprinkler head is activated (e.g. a flow switch).

Stage: A floor or platform in a Class 9b building on which performances are presented before an audience.

Stairway platform lift: A power-operated device for raising or lowering people with limited mobility on a platform (with or without a chair) in the direction of a stairway.

Storey: A space within a building which is situated between one floor level and the floor level next above, or if there is no floor above, the ceiling or roof above, but not—

(a) a space that contains only—
   (i) a lift shaft, stairway or meter room; or
   (ii) a bathroom, shower room, laundry, water closet, or other sanitary compartment; or
   (iii) accommodation intended for not more than 3 vehicles; or
   (iv) a combination of the above; or
(b) a mezzanine.

Structural adequacy: In relation to an FRL, means the ability to maintain stability and adequate loadbearing capacity as determined by AS 1530.4.

Structural member: A component or part of an assembly which provides vertical or lateral support to a building or structure.

Substantive parts of a building or structure: Those parts of a building or other structure that serve the purpose for which the building or structure has been constructed, including but are not limited to—
(a) the whole of a building or structure; and

(b) any significant portion of a building or structure (such as habitable or non-habitable storey, a roof system, a floor system, a system of loadbearing walls and the like) which could result in loss of life or injury should it fail.

Sudden failure: Relatively rapid collapse of a structure that occurs with little warning with little plastic deformation and/or moment redistribution.

Surface water: All naturally occurring water, other than sub-surface water, which results from rainfall on or around the site or water flowing onto the site.

Swimming pool: Any excavation or structure containing water and principally used, or that is designed, manufactured or adapted to be principally used for swimming, wading, paddling, or the like, including a bathing or wading pool, or spa.

Tapered tread: A stair tread with a walking area that grows smaller towards one end.

Thermal comfort level: The level of thermal comfort in a building expressed as a PMV sensation scale.

Total R-Value: The sum of the $R$-Values of the individual component layers in a composite element including any building material, insulating material, airspace, thermal bridging and associated surface resistances, expressed in m$^2$.K/W.

(a) For the purposes of Volume One, the fraction of incident irradiance on a wall-glazing construction or a roof light that adds heat to a building’s space.

(b) For the purposes of Volume Two, the fraction of incident irradiance on glazing or a roof light that adds heat to a building’s space.

(a) For the purposes of Volume One, the thermal transmittance of the composite element allowing for the effect of any airspaces, thermal bridging and associated surface resistances, expressed in W/m$^2$.K.

(b) For the purposes of Volume Two, means the thermal transmittance of the composite element allowing for the effect of any airspaces and associated surface resistances, expressed in W/m$^2$.K.

Transient actions: The combination of structural actions in which the combined magnitude of the permanent gravity action and imposed gravity action is less than 50% of the magnitude of the total combined actions.

Treatment area: An area within a patient care area such as an operating theatre and rooms used for recovery, minor procedures, resuscitation, intensive care and coronary care from which a patient may not be readily moved.

Uncontrolled discharge: Any unintentional release of fluid from a plumbing and drainage system and includes leakage and seepage.

Unique wall: For the purposes of F1V1 in Volume One and H2V1 in Volume Two, a wall which is neither a cavity wall nor a direct fix cladding wall.

Unobstructed opening: For the purposes of Section 8 of the Housing Provisions, a glazed area that a person could mistake for an open doorway or clearway and walk into the glazed panel.

Unreinforced masonry: Masonry that is not reinforced.

Vapour pressure: The pressure at which water vapour is in thermodynamic equilibrium with its condensed state.

Ventilation opening: An opening in the external wall, floor or roof of a building designed to allow air movement into or out of the building by natural means including a permanent opening, an openable part of a window, a door or other device which can be held open.

Verification Method: A test, inspection, calculation or other method that determines whether a Performance Solution complies with the relevant Performance Requirements.

Vessel: For the purposes of Volume One and Part 10.2 of the Housing Provisions, an open, pre-formed, pre-finished concave receptacle capable of holding water, usually for the purpose of washing, including a basin, sink, bath, laundry tub and the like.

Visibility: The maximum distance at which an object of defined size, brightness and contrast can be seen and recognised.

Voltage: A difference of potential, measured in Volts (V) and includes extra-low voltage and low voltage.

(a) In relation to a building — the volume of the total space of the building measured above the lowest floor (including, for a suspended floor, any subfloor space), over the enclosing walls, and to the underside of the roof covering.

(b) In relation to a fire compartment — the volume of the total space of the fire compartment measured within the inner finished surfaces of the enclosing fire-resisting walls and/or floors, and—

(i) if there is no fire-resisting floor at the base of the fire compartment, measured above the finished surface of the lowest floor in the fire compartment; and

(ii) if there is no fire-resisting floor at the top of the fire compartment, measured to the underside of the roof.
covering of the fire compartment, and

(iii) if there is no fire-resisting wall, measured over the enclosing wall and if there is no enclosing wall, includes any space within the fire compartment that has a use which contributes to the fire load.

(c) In relation to an atrium — the volume of the total space of the atrium measured within the finished surfaces of the bounding construction and if no bounding construction, within the external walls.

Waffle raft: A stiffened raft with closely spaced ribs constructed on the ground and with slab panels supported between ribs.

Wall-glazing construction: For the purposes of Section J in Volume One, the combination of wall and glazing components comprising the envelope of a building, excluding—

(a) display glazing; and

(b) opaque non-glazed openings such as doors, vents, penetrations and shutters.

Ward area: That part of a patient care area for resident patients and may contain areas for accommodation, sleeping, associated living and nursing facilities.

Water control layer: A pliable building membrane or the exterior cladding when no pliable building membrane is present.

WaterMark Certification Scheme: The ABCB scheme for certifying and authorising plumbing and drainage products.

WaterMark Conformity Assessment Body (WMCAB): A conformity assessment body registered with and accredited by the JAS-ANZ to conduct evaluations leading to product certification and contracted with the administering body to issue the WaterMark Licence.

WaterMark Licence: A licence issued by a WaterMark Conformity Assessment Body.

WaterMark Schedule of Excluded Products: The list maintained by the administering body of products excluded from the WaterMark Certification Scheme.

WaterMark Schedule of Products: The list maintained by the administering body of products included in the WaterMark Certification Scheme, and the specifications to which the products can be certified.

Explanatory Information:
The WaterMark Schedule of Products and the WaterMark Schedule of Excluded Products can be viewed on the ABCB website at www.abcb.gov.au.

Waterproof: The property of a material that does not allow moisture to penetrate through it.

Waterproofing system: A combination of elements that are required to achieve a waterproof barrier as required by H4D2 and H4D3 including substrate, membrane, bond breakers, sealants, finishes and the like.

Water resistant: The property of a system or material that restricts moisture movement and will not degrade under conditions of moisture.

Water sensitive materials: Materials that have an inherent capacity to absorb water vapour and include timber, plasterboard, plywood, oriented strand board and the like.

Waterstop: A vertical extension of the waterproofing system forming a barrier to prevent the passage of moisture in the floor.

Watertight: Will not allow water to pass from the inside to the outside of the component or joint and vice versa.

Weighted average: Is calculated across the wetted surface area of a pipe, pipe fitting or plumbing fixture.

Wet area: An area within a building supplied with water from a water supply system, which includes bathrooms, showers, laundries and sanitary compartments and excludes kitchens, bar areas, kitchenettes or domestic food and beverage preparation areas.

Wetted surface area: Is calculated by the total sum of diameter (D) in contact with drinking water.

Winders: Treads within a straight flight that are used to change direction of the stair (see Figure 4).

Window: includes a roof light, glass panel, glass block or brick, glass louvre, glazed sash, glazed door, or other device which transmits natural light directly from outside a building to the room concerned when in the closed position.

Withstand: For the purposes of A8G3(1) means that in response to an imposed fire action the following conditions must not occur:

(a) Fire spread more than 5m above an opening in the façade through which flames are venting.
(b) **Fire spread more than 2m beyond the extent of flames from a burning item adjacent to the structure such as a vehicle, waste bin, collection of combustible rubbish depending on the use and access to adjacent areas.**

(c) **Ignition and propagation as the result of the imposed heat flux from a fire in an adjacent building or potential building on an adjoining allotment (embers are likely to be present and therefore piloted ignition should be considered if combustible materials are present).**

(d) **Ignition and fire propagation within cladding materials and building cavities.**

(e) **Release of flaming droplets.**

(f) **Release of significant quantities of debris (criteria should be developed during the PBDB process having regard for the proximity of other property and the requirements of the emergency services).**

(g) **Structural failure.**

---

**Explanatory Information:**

For item (f), the risk to life of occupants evacuating the building from falling debris should be evaluated under A8G2.

**Yield:** The mass of a combustion product generated during combustion divided by the mass loss of the test specimen as specified in the design fire.

**Zone protection:** The installation of a backflow prevention device at the point where a water service is connected to multiple fixtures or appliances, with no backflow prevention device installed as individual protection downstream of this point.

Table Notes:

1. For AS/NZS ISO 717.1:
   (i) Test reports based on AS 1276—1979 and issued prior to AS/NZS 1276.1—1999 being referenced in the NCC remain valid.
   (ii) The STC values in reports based on AS 1276—1979 shall be considered to be equivalent to $R_w$ values.
   (iii) Test reports based on AS/NZS 1276.1 prepared after the NCC reference date for AS/NZS 1276.1—1999 must be based on that version.
   (iv) Test reports based on ISO 717-1—1996 and issued prior to AS/NZS ISO 717.1—2004 being referenced in the NCC remain valid.
   (v) Reports based on AS/NZS ISO 717.1 relating to tests carried out after the NCC reference date for AS/NZS ISO 717.1—2004 must relate to the amended Standard.

2. For AS 1530 Parts 1 to 4:
   (i) Until 1 May 2022, subject to the note to AS 4072.1, reports relating to tests carried out under earlier editions of AS 1530 Parts 1 to 4 remain valid.
   (ii) Reports relating to tests carried out after the date of an amendment to a Standard must relate to the amended Standard.

3. For AS 1562.1, tests carried out based on AS 1562.1—1992 and issued prior to AS 1562.1—2018 being referenced in the NCC remain valid. Reports relating to tests carried out after the NCC reference date for AS 1562.1 must relate to the revised Standard.

4. For AS 1670.1, AS 1670.3 and AS1670.4:
   (i) Notwithstanding AS4G1(5), until 1 May 2022 either the current edition or the previous editions of the documents listed in Table 1.8 of AS 1670.1, AS 1670.3 and AS 1670.4 may be used to meet the requirements of AS 1670.1, AS 1670.3 and AS 1670.4 as applicable.
   (ii) From 1 May 2022 AS4G1(5) applies and only the edition of the documents listed in Table 1.8 of AS 1670.1, AS 1670.3 and AS 1670.4 that existed at the time of publication of the primary document may be used.
   (iii) For AS/NZS 1859.4, the 2004 edition has been retained for a transitional period ending on 30 April 2020.

5. For AS 2047:
   (i) Tests carried out under earlier editions of AS 2047 remain valid.
   (ii) Reports based on AS 2047 relating to tests carried out after the NCC reference date for AS 2047—2014 Amendment 2 must relate to the amended Standard.

6. For AS 3786:
   (i) Tests carried out under AS 3786—2014 Amendment 1 remain valid.
   (ii) Reports based on AS 3786 relating to tests carried out after the NCC reference date for AS 3786—2014 Amendment 2 must relate to the amended Standard.

7. Test reports based on the 2005 edition of AS/NZS 4020 will continue to be accepted until 1 May 2024. Test reports prepared after the NCC reference date for the

8. For AS 4072.1, until 1 May 2022, systems tested to AS 1530.4 prior to 1 January 1995 need not be retested to comply with the provisions in AS 4072.1.

9. For AS 4586:
   (i) Test reports based on the 2004 edition of AS/NZS 4586 and issued prior to the 2013 edition of AS 4586 being referenced in the NCC remain valid.
   (ii) Test reports prepared after the NCC reference date of the 2013 edition of AS 4586 must be based on that version.
   (iii) For the purposes of assessing compliance, the slip-resistance classifications of V, W and X in reports based on the 2004 edition of AS/NZS 4586 may be considered to be equivalent to slip-resistance classifications of P5, P4 and P3 respectively in the 2013 edition of AS4586.
   (iv) Test reports based on Appendix D of AS 4586—2013 and issued prior to the NCC reference date for AS 4586—2013 (incorporating Amendment 1) remain valid.
   (v) Test reports based on Appendix D of AS 4586—2013 and prepared after the NCC reference date for AS 4586—2013 (incorporating Amendment 1) must be based on that version.

10. Tests carried out based on AS/NZS 2918—2001 and issued prior to AS/NZS 2918—2018 being referenced in the BCA remain valid. Reports relating to tests carried out after the NCC reference date for AS/NZS 2918 must relate to the revised Standard.

11. For AS 2699 Parts 1 and 3:
   (i) For AS 2699.1, the 2000 edition has been retained for a transitional period ending on 30 April 2025.
   (ii) For AS 2699.3, the 2002 edition has been retained for a transitional period ending on 30 April 2025.
